**ANNEXES
(OCTOBER 2020)**

ANNEX 1. LIMITS OF THE COASTAL ZONE MANAGEMENT AREA

Geographic coordinates of the updated Coastal Zone Management Area (CZMA) are provided in this annex. CZMA is defined by two boundaries, inland boundary and offshore boundary defined by (longitude (LON) and latitude (LAT) coordinates each 50m. A total of 2185 points delineate the inland boundary and a total of 2171 points delineate the offshore boundary.

ANNEX 2. BASELINE STUDIES AND RISK ASSESSMENTS DEVELOPED BY THE CZMU

REPORT	CONTENTS
Circulation Water Quality & Sedimentation Study. Phase 1 Report	A review of previous works completed concerning water quality, terrestrial loads, and circulation in Holetown, Bridgetown and Conset Bay
Circulation Water Quality and Sedimentation Study. Phase 3. Model Calibration, Verification and Clean-up Scenarios	Model calibration/validation and potential clean-up scenarios to reduce contaminant loadings to the receiving coastal waters
Circulation Water Quality and Sedimentation Study. Phase 4. Summary Report	Summary of the work completed during the CWQS study, including data assembly and review, field monitoring programs, groundwater assessment, numerical modelling activities, and the assessment of clean-up scenarios
CRMP Ecosystem-Based Adaptation Pilot Project. Water Quality and Reef Information Report	Summary of the initial findings from the first campaign for the EBA and analysis of the results and the historical quality measurements
Ecosystem-Based Adaptation Pilot Project. Phase 1. Report	Summary of the technical studies completed during the first year of the EBA pilot project, which analyses the feasibility of reef restoration as an NbS to mitigate the impacts of Climate Change
Ecosystem-Based Adaptation Pilot Project. Coral Nursery – Final Report	Description of the Coral Nursery Pilot project carried out within the EBA project
Geotechnical surveys Investigation. Field Study Report	Results of the data collection and field investigations completed in this part of the CRMP study, which include: geological maps, cliff undercut surveys, downhole camera and optical televiewer surveys, instrumentation installation and monitoring records, and laboratory testing results.
Geotechnical surveys Investigation. Assessment Report	Results of the data interpretation, analysis and geotechnical modelling carried out to assess the stability of the slopes and cliffs within the coastal zone
CRMP Nearshore Wave Study. Phase 1. Report	Review of previously recorded wave data and past hindcasts in the vicinity of the Barbados coastline
CRMP Nearshore Wave Study. Phase 3a. Report	Review of past data, collection of new data, and development of a long-term data collection program as well as the development of a numerical model to produce wave climates for different locations around the island
CRMP Nearshore Wave Study. Phase 3b. Report	
CRMP Shoreline Change Study. Phase 1. Data Preparation Progress Memorandum	Summary of the ongoing data preparation for the shoreline change analysis, including the sources of historical imagery, steps involved in generating ortho-photographs for the coast of Barbados
CRMP Shoreline Change Study. Phase 2. Report on Expansion and Improvements to the Beach Profile Monitoring Program	A review of the existing beach monitoring program and new recommendations for future improvements

REPORT	CONTENTS
CRMP Shoreline Change Study. Phase 3. Report on the QA/QC Process	Analysis of the shoreline changes for different time periods of historic aerial imagery, classification of the coastal zones based on shoreline trends and providing information for decisions about future monitoring
RMP Shoreline Change Study. Phase 4. Report on Training	Final recommendations on coastal monitoring
Sediment Transport Study. Final Report	Literature review about the sediment budget along the Barbados coastline, Data about sediment samples from beaches around Barbados and results of an encapsulated sediment budget model that formulates the balance between supply and loss of sediment for individual beaches under different SLR scenarios
Update of the System of Indicators of Disaster Risk and Risk Management to Barbados	Results for Barbados for the indicators DDI (Disaster Deficit Index), LDI (Local Disaster Index), PVI (Prevalent Vulnerability Index) and RMI (Risk Management Index)
National Hazard Mapping Risk Atlas	Maps to illustrate the areas that are exposed to the different hazards identified in Barbados, at specific return period levels
National Coastal Risk Information and Planning Platform. Final Hazard Report	Development of hazard data (wind, earthquakes, landslides, storm surge, coastal erosion, flooding due to rainfall, tsunami and oil spills) for Barbados
National Coastal Risk Information and Planning Platform. Final Vulnerability Report	Analysis of the exposure and susceptibility of socioeconomic and environmental items to the identified hazards in Barbados
National Coastal Risk Information and Planning Platform. Revised Revised Draft Risk Report	Calculating financial damage (referred to as risk) resulting from the assessed hazards in previous reports. Risk is computed for multiple hazards at various return periods for a range of assets

Table Annex 2.1. Baselines studies and risk assessments developed by the CZMU during last years.

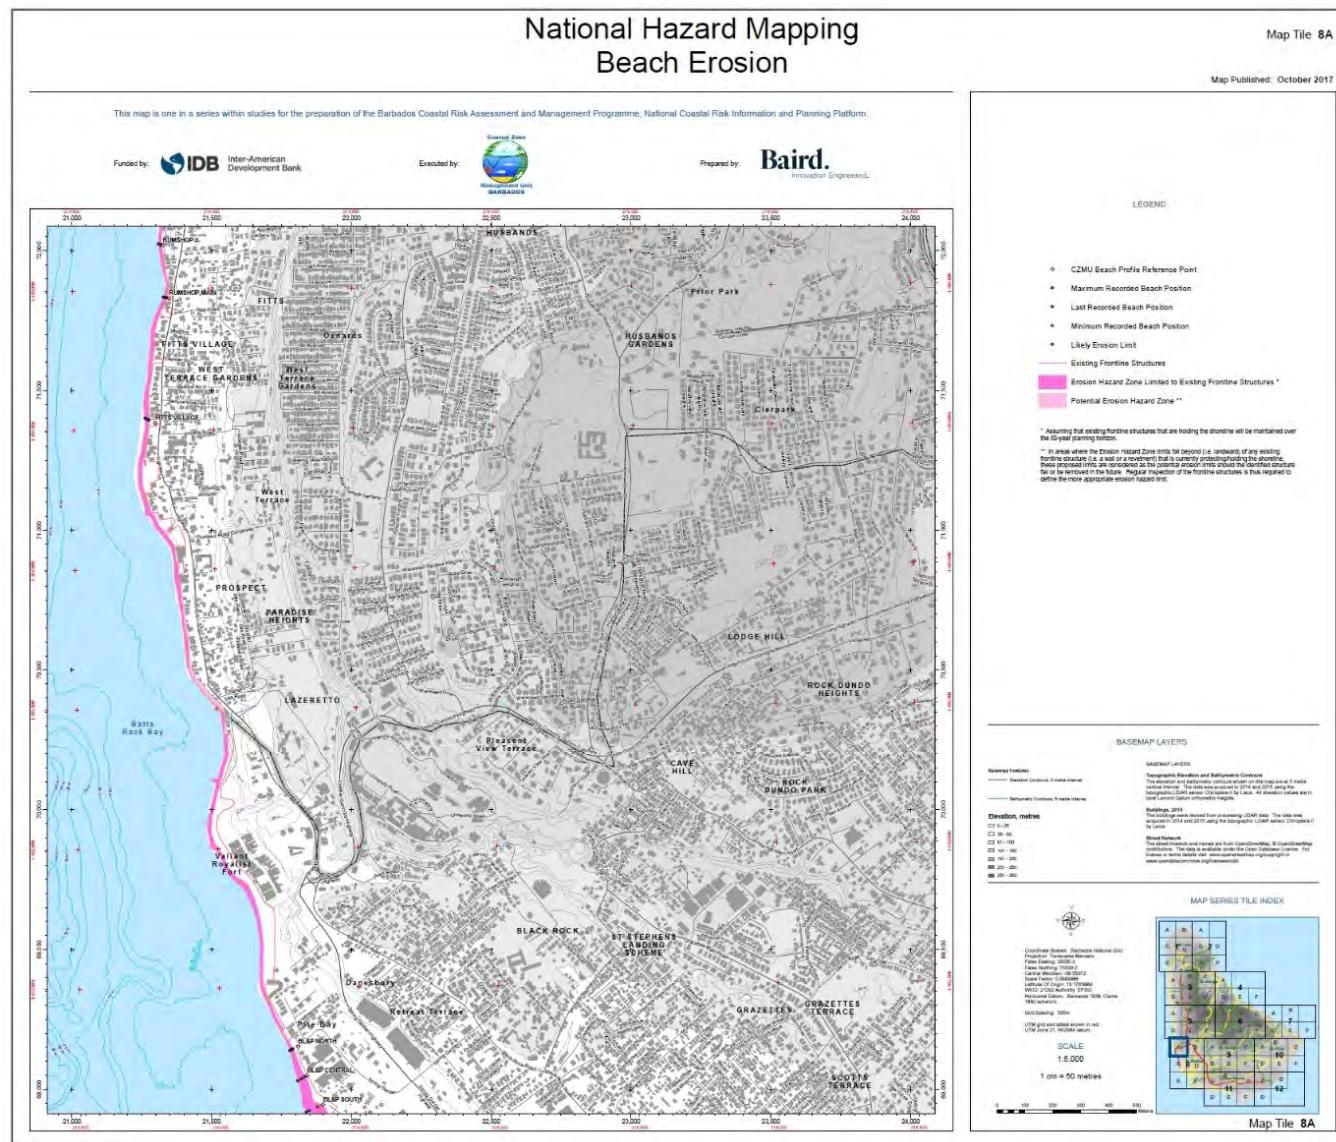

ANNEX 3. CLIMATE CHANGE TRENDS AND PROJECTIONS

HISTORICAL TREND	FUTURE PROJECTION
<p>Temperatures</p> <ul style="list-style-type: none"> • Mean temperature has increased at 0.1°C/decade • Maximum and minimum temperatures show an upward (linear) trend. Reanalysed records (1901-2015) suggest +0.094°C/decade for maximum temperatures and +0.10°C/decade for minimum temperatures. • Daily temperature range has decreased slightly. • Maximum and minimum temperature extremes near Barbados have increased at 0.1-0.3 °C/decade over 1961-2010. • Frequency of warm days and warm nights have shown statistically significant increases. • Frequency of cool days and nights have declined across the Caribbean by approximately 1.8% and 2.6% respectively over the 1961-2010 period. 	<p>Temperatures</p> <ul style="list-style-type: none"> • Minimum, maximum and mean temperatures increase irrespective of the climatic scenario through the end of the century. These temperature increases occur across all seasons of the year. • The projected mean temperature increase from selected RCP climatic scenarios in the GCMs are: <ul style="list-style-type: none"> • 0.56-0.68°C for the 2020s; • 0.71-0.96°C for the 2030s, • 0.85 – 1.59°C for the 2050s and • 0.78-2.82°C for 2081-2100. • RCMs suggest increases in mean temperature of up to 0.89°C by the 2050s
<p>Rainfall</p> <ul style="list-style-type: none"> • Significant year-to-year variability due to the influence of phenomena like the El Nino Southern Oscillation (ENSO). • An upward trend in mean is observed at 0.197 mm/year over Barbados though a strong decadal signal is also evident. • Two long-term stations in Barbados suggest no discernible change in consecutive dry days and frequency of days above 10 mm rainfall in recent past but slightly increase in very wet days (R95p). Trends diverge for max 1-day and max 5-day rainfall. • A 2014 study suggests that for 1986-2010, Barbados shows an increase in total precipitation as well as an increase in the daily rainfall intensity index although both are not considered statistically significant. 	<p>Rainfall</p> <ul style="list-style-type: none"> • Rainfall shows a slight decrease across all scenarios through to the end of the century. • The mean annual precipitation is projected from GCMs to have decreases of 3 – 5% for 2020s, 3– 6% for 2030s, 2 – 14% for 2050s and 4 – 25% for the end of century. • This drying is projected to occur in both the wet season (August to November) by up to 11% and the dry seasons (Dec. to Mar.) up to 18% by mid-century (2046-2065) from GCM data. • One RCM projects modest declines of up to 4% by the 2050s which overlaps with projections from GCMs. • Two RCMs predict little discernible change in consecutive dry days and frequency of days above 10 mm rainfall. These RCMs also predict small increases in the number of very wet days, the maximum 1-day precipitation and maximum 5-day precipitation. • A detailed analysis of rainfall intensity (Acclimatise, 2016) for Barbados showed significant uncertainty with respect to future trends with changes of -70% to +45% possible in the next 50 years.

HISTORICAL TREND	FUTURE PROJECTION
<p>Sea Levels*</p> <ul style="list-style-type: none"> Historical trends show a regional rate of increase of 0.18 ± 0.01 mm/year between 1950 and 2010. Higher rate of increase in later years: up to 3.2 mm/year between 1993 and 2010. Caribbean Sea level changes are similar to the overall global mean. 	<p>Sea Levels*</p> <ul style="list-style-type: none"> The combined range for a projected rise over all GCM scenarios spans 0.26 to 0.82 m by 2100 relative to 1986-2005 levels. The range is 0.17 to 0.38 m for 2046 – 2065. It is suggested that gravitational and geophysical factors will lead to the region experiencing a greater rise in sea levels than most global areas. Sea-level rise over the northern Caribbean may exceed the global average by 25%. Other recent studies suggest an upper limit for the Caribbean of up to 1.5 m for the most pessimistic future climatic scenario (RCP8.5).
<p>Hurricanes</p> <ul style="list-style-type: none"> Increase in frequency and duration of Atlantic hurricanes since 1995. Increase in Category 4 and 5 hurricanes and in rainfall intensity, associated peak wind intensities, and mean rainfall for the same period. 	<p>Hurricanes</p> <ul style="list-style-type: none"> No change or slight decrease in the frequency of hurricanes. An 80% increase in the frequency of Saffir-Simpson category 4 and 5 Atlantic hurricanes over the next 80 years using a future compromise or average climatic scenario (A1B). Shift toward stronger storms by the end of the century as measured by maximum wind speed increases of +2 to +11%. +20% to +30% increase in rainfall rates for the model hurricane's inner core, with a smaller increase (~10%) at radii of 200 km or larger.

LEGEND

Coefficient Flooding due to Storm Surge

Coast flooding is a complex process that is influenced by the bathymetry, wave conditions, water depth, bathymetry, and presence of beach berms, coastal structures, groundwater levels, sea walls, buildings, and vegetation. The wave runup and wave overtopping elevations depicted on the maps represent the estimated water surface elevation that would occur if a specific storm surge event were to occur. The exact elevation that waves will travel inland will depend on the volume of the waves, local topographic variations, inundation, and influences such as wave runup and flood surges. These may vary by < -0.3 m to more than 1 m.

Return Periods: The time during which a specific event is expected to occur or average every 17 years. For example a 10 year return period could be assessed in historical data by extracting the maximum level from each decade for an appropriate long period of time.

AEP or Annual Exceedance Probability is the annual probability that a specific hazard event will be exceeded in any given year. The AEP is the inverse of the return period. For example, a 10% AEP corresponds to a 10 year return period. E.g. AEP of 1% is close to a 10 year return period.

Data boxes are associated with each profile location along the coast and provide key elevation values (in ft) for the 25, 50, 100 and 150 year events. The 100 and 150 year events represent the maximum runup level on the shore, or the 2% highest wave crest passing over the beach crest. If the runup exceeds the height of the beach berm, the elevation value is the height of the berm. For example, at the west end, the data box contains an "11" for inundation. If inundation is taking place, the second elevation value is the expected ponded water surface elevation. If only runup is occurring (denoted "R"), then a second value is provided.

Simulations were undertaken to depict the 25, 50, 100 and 150 year events. The 100 and 150 year events were similar in runup and overtopping magnitude such that the values were often close to equal and therefore only one value was provided. The 100 year event is represented by the 100 year event. The 150 year event should be considered to be similar, yet slightly higher.

Longshore: Wave runup and overtopping were calculated based on data from the 2015 LiDAR survey and extrapolated to the 2010 base case. The 2015 LiDAR survey data is the most recent available. The wave runup elevations are based on a 2% exceedance. Infrequent waves could exceed these elevations. Wave runup and overtopping elevations may vary substantially between profiles due to differences in wave runup and overtopping magnitudes.

Severe Spray Hazard

A severe spray hazard exists on sections of the east coast, where deep water allows large waves to impact cliffs. Very high spray, sometimes mixed with rubble or boulders can result in localized regions where setbacks of 100 to 200 m may be required. Site specific assessments should be undertaken for development in these regions.

Maximum Pounding	Hazard Mapping Features
Red = 100 Year Period	Red = 100 Year Period
Yellow = 50 Year Period	Yellow = 50 Year Period

ANNEX 5. SAMPLE VULNERABILITY MAP

ANNEX 6. SOCIAL IMPACT ASSESSMENT AND GENDER ANALYSIS

1. The SIA will investigate socio-economic developmental opportunities and risks related to the execution of the project; and inform possible mitigation measures to safeguard against any risks identified, as well as other measures to support positive social impacts. It will be conducted in a highly participatory, gender-inclusive manner engaging the communities, particularly with representatives of women and men and vulnerable groups such as children, youth, elderly, persons with disabilities (PWDs) etc.

2. The methodology for the SIA shall include, but is not be limited to, the following:

(a) Review of secondary data including reports, studies, gender assessments, poverty assessments, census reports, labour force surveys, and relevant policy documents such as legislation, regulations, standards and policies in the areas of gender and social development including vulnerable groups of women, youth, PWDs and human trafficking victims.

(b) Collection of primary data through participatory consultations with all categories of stakeholders in order to introduce the project, facilitate feedback, and gauge perception of the project in order to gain and/or strengthen buy-in. Interviews, focus groups and other appropriate differential participatory methodologies may be employed for state and non-state stakeholders directly impacted by the works such as Community-Based Organisations, Non-Governmental Organisations, vulnerable groups (to include elderly, children, youth, men, women, PWDs, and indigenous peoples), private sector entities and relevant public agencies. Where applicable, focus groups may be convened for youth, PWDs, males and females, respectively. Facilitation of participation through the provision of transportation and child care as well as appropriate timing should be ensured. Data should be disaggregated by sex, age groups, disability status and race/ethnicity where feasible.

(c) Execution of site visit exercises to verify, update and fill gaps using community maps, transect walks, snowballing, as well as photographic documentation, and other appropriate participatory approaches.

3. The scope of work shall examine and report on the following, and related developmental issues:

(a) Describe the project areas including demographic, economic, topographical and sociocultural data which should be disaggregated by sex, age groups, minority or special needs groups (such as PWDs, youth, immigrants, and informal settlers):

- (i) total population of the project areas (Parish communities/villages);
- (ii) population density of the project areas (Parish communities/villages);
- (iii) number of households by sex of household head;
- (iv) labour force participation, employment and occupation;
- (v) crime and violence; and
- (vi) prevalence of poverty.

(b) Investigate the governance and management structure in the appropriate sector (institution) of Government in Barbados, including staff ratios by occupation and sex), equality in recruitment, workplace policies conducive for women, occupational health and safety.

(c) Assess the different social as well as household activities of men and women, and vulnerable youth, PWDs in project areas.

(d) Assess economic activities or potential future economic activity by sex for the project areas and need for areas for vendors, sanitation facilities, parking, illumination needs and other basic facilities necessary to be covered in the design of the project infrastructure. This assessment should address competing users of the proposed infrastructure including social service providers, commercial sector operators; and private citizens.

(e) Analyse the local labour force and the potential of engaging communities, especially abovementioned vulnerable groups, in the construction and maintenance and resilience building phases of the project. Give recommendations on training needs and legal requirements from a procurement perspective. Identify the number of men, women and other vulnerable groups identified who will benefit from employment during project implementation and subsequent operation.

(f) Propose project components (initiatives) necessary to facilitate the access and participation of youth, women and PWDs in the economic and social benefits of the proposed project. The institutional partners necessary for the success of the project components (initiatives) and the budget to implement them must be clearly identified.

(g) Assess accessibility of the project areas in keeping with universal design standards required for use by PWDs, and seek direct feedback from PWDs regarding the requirements, to inform the design of the proposed infrastructure.

(h) Identify the effects of the project on time use in the household disaggregated by sex; and how men and women would use the time savings differently. Differentiate the time use benefits for public and private sectors as well as for householders.

(i) Identify any deficiencies in transport arrangements that hinder men, women, indigenous peoples and relevant vulnerable groups from fully accessing services and markets. The assessment should examine:

(i) different travel patterns of women and men;

(ii) who pays for the commercial, household and other transportation, disaggregated by sex;

(iii) how the travel pricing structure would change due to the project, i.e. cost implications for consumers (if possible, disaggregated by sex); and

(iv) expected performance/service of existing transport networks, and the potential needs of the population in beneficiary communities and/or the project areas during works and post-completion of works, disaggregated by sex and vulnerable groups identified.

(j) Identify any activities related to transactional and commercial sex in the project areas and analyse both the potential effects of the construction and operational phases of the project.

(k) Evaluate public illumination needs and the potential for preventing crime, including gender-based violence and sexual assault. Identify “hot spots” together with the police and the communities engaging women, men, youth and PWDs as they have different perspectives and advice on the placement of street lights and necessary preventative measures.

(l) Determine potential social and economic dislocation in the project areas and whether resettlement/replacement is necessary. Identify any possible effects of this on the livelihoods and culture of people in the project areas. Identify possible social and gender concerns taking into account the distribution of male and female-headed households, distribution of land titles by sex, and any other

vulnerable group. Identify any possible options to avoid resettlement as well as appropriate gender-responsive resettlement (possible distribution of land titles to women) and mitigation measures.

(m) Describe the potential impacts of the project at its various stages (preparation, construction, and operation) on the social and economic contexts in the immediate surrounding communities. Identify any issues pertaining to the design of the project which may have social impacts including gender, livelihood or other dimensions.

(n) Make specific recommendations with regard to the project design options and identify measures required not only to mitigate any significant negative impacts, and enhance the potential social and gender benefits in the project areas. This process shall:

(i) Discuss the adequacy of proposed mitigation measures overall, and specific measures to enhance gender equality and equitable inclusion of vulnerable groups and any other relevant social benefits; as well as the adequacy of project design to meet the needs of the relevant stakeholders.

(ii) Consider measures such as public education and, training opportunities for vulnerable groups to take part in project activities, workers code of conduct and grievance mechanisms; and reform of workplace, human resources and customer service policies.

(iii) Define Community Participatory Mechanisms (CPMs) by identifying appropriate mechanisms to engage women, men and vulnerable groups in the decision-making of the project in a gender-balanced way; and appropriate gender-sensitive public education communication strategies for providing information on project activities to stakeholders and for receiving timely feedback (pre-project, during implementation and post-implementation). The CPM design must ensure conducive meeting times and facilitate participation through the provision of transportation, child care, and other supportive measures.

(iv) Estimate the cost of the measures and justify their suitability.

(v) Prepare a detailed monitoring and evaluation plan for tracking the key relevant project results and the implementation of the mitigating and benefit-supporting measures. Identify gender-responsive outputs and outcomes of the project activities to facilitate gender-responsive results monitoring and evaluation.

(vi) Develop a Gender Action Plan containing relevant gender and social inclusion actions, indicators, timelines and budget. (o) Analyse and outline the key SIA findings regarding: (i) social and gender benefits arising from the project and measures to maximise the benefits; and (ii) social and gender risks and measures to mitigate the risks for beneficiaries including the sub-groups requiring focussed attention. The key SIA findings including measures such as universal design standards required for use by PWDs, areas for vendors, sanitation facilities, parking, public illumination, and other basic facilities must be discussed with the engineers on the team for consideration in the design of the proposed project infrastructure.

(p) Convene a stakeholders' validation workshop, including community groups, representatives of vulnerable population groups (women, elderly, youth, indigenous people and persons with disabilities), and relevant Barbados government agencies, to discuss the findings of the consultancy and to seek consensus and clarification on issues from participants for incorporation in the Draft Final and Final Reports. As part of the stakeholders' validation workshop conduct gender sensitisation training to report on the findings of the gender analysis.

ANNEX 7. DRAFT TERMS OF REFERENCE CLIMATE RISK AND VULNERABILITY ASSESSMENTS

1. BACKGROUND

1.01. A Climate Risk and Vulnerability Assessment (CRVA) will be conducted on the project components as part of the design process to ensure that they are strengthened against climate risks (to develop depending on the exact project details and requirements).

2. OBJECTIVES

2.01 The objectives of the CRVA are to (i) identify and evaluate the potential effects of climate change on the project on the project area and (ii) recommend resilience measures to address the identified risks and vulnerabilities and minimise impacts. This should include consultation with stakeholders to get a better understanding of the nature of the climate risk and adaptation issues, especially the historical experience of climate related hazards, the response and to agree on the scope.

3. METHODOLOGY

3.01 The consultants are expected to develop a database, if one does not already exist, that would include, inter-alia, the following data and information:

- (a) Background information on the project; and
- (b) Locational characteristics of the project area geographic scope.

4. SCOPE OF SERVICES

4.01 The consultants will be required to perform the following tasks:

- (a) Identification and description of project components
- (b) Hazard Identification and Characterisation
 - (i) Summarise the key current and expected future climate hazards relevant in the context of the project, and of the associated potential climate-related risks/implications for the Project, that should be addressed in the CRVA, during the construction and operational phases; and
 - (ii) Establish a climate baseline for the relevant climate variables and establish a climate baseline;
 - (iii) Undertake an in-depth assessment, combining an analysis of historical events and present day conditions in order to establish a climate baseline, with an analysis of future conditions (mid-century as well as the design life of the investment) using scenario-based methodologies. Climate variables could include the following: (aa) sea level and wave action; (bb) storm surges (cc) peak rainfall events; (dd) temperatures; (ee) profiles of past extreme weather events; and (ff) wind speed.
- (c) Assessment of Exposure

4.02 The consultant will (i) assess the exposure of project components that could be exposed to the hazards identified above and the extent of this exposure. This should include preparation of hazard maps showing the spatially distributed expected exposure levels for different frequencies (i.e. 50-yr, 100-yr and 150-yr return periods) and for different hazard types (extreme precipitation, flooding, landslides, sea level rise, etc).

(d) Vulnerability Assessment

4.03 The consultant will establish climate change scenarios and assess the relationship between the changes in the climate parameters agreed on in (b) and the impacts on project components. The assessment of vulnerabilities considers in detail how the project components, and communities would be vulnerable to the identified hazards according to different climate scenarios, as well as non-climate factors.

(e) Risk assessment

4.04 The consultant will conduct a risk assessment (a quantitative expression of the vulnerability assessment: the consequences of the hazards, in economic and social impact terms, on project components.

(f) Adaptation Assessment

4.05 The consultant shall identify the most appropriate adaptation measures that could be incorporated into the Project in order to address the vulnerabilities and risks identified. This may include structural, technological and behavioural measures.

5. REPORTING REQUIREMENTS

5.01 The consultants will report to the CZMU's Project Manager. The Technical Proposal of the selected consultant shall outline a work plan and approach to the assignment, the scope and methodology, the tasks and responsibilities and a time schedule for the completion of the assignment. The following reports, one hard copy each, along with an electronic copy either by electronic mail, on CD ROM or flash drive, shall be submitted to the CZMU at the times indicated below.

- (a) Inception Report within three weeks of commencement of the assignment;
- (b) Draft report on completion of the risk assessment;
- (c) Final report on the CRVA specifying the recommended design changes to take account of climate risks, including an analysis of structural and non-structural measures.

6. TIMING AND QUALIFICATIONS

6.01 Duration: circa 30-40 working days.

6.02 The consultancy shall be conducted by a team of three experts, who shall have the following competencies:

(a) Climate Change Specialist: Responsible for identifying the climate change parameters to be assessed; collection of relevant local historical climate data and climate change projections; identify the probabilities of specific climate change occurrences; conduct field investigations with local stakeholders to identify existing vulnerabilities. In consultation with other team members, contribute to the identification of adaptation options, including their costs and benefits and prioritisation. The consultant is expected to have at least five years' work experience in the area of climate change impacts adaptation and mitigation. Knowledge of the Climate Change Adaptation context in the Caribbean region would be a plus.

(b) Engineer: Civil Engineer will lead the characterisation and technical assessment of project infrastructure and operations in the energy sector; conduct interviews with relevant organisations and stakeholders; and undertake site visits to determine the existing infrastructure conditions and proposals for rehabilitation. The specialist will assist in the preparation of cost estimates for capital and recurrent costs for the recommended resilience measures.

(c) Economist: The Economist should have at least 10 years of experience and a graduate degree or equivalent. Experience should include economic analysis of development projects and sector strategies based on economic analyses. Experience with incorporating climate change concerns into economic analysis as well as multi criteria analysis will also be required.

ANNEX 8. STANDARD FORMS FOR COASTAL RESEARCH

- Draft standard form A: Application for consent to conduct marine scientific research

Application for consent to conduct Marine scientific research

Date: _____

1. General Information

1.1 Cruise name and/or number:	
1.2 Sponsoring institution(s):	
Name:	
Address:	
Name of Director:	
1.3 Scientist in charge of the project:	
Name:	
Country:	
Affiliation:	
Address:	
Telephone:	
Fax:	
Email:	
Website (for CV and photo):	

1.4 Entity(ies)/Participant(s) from coastal State involved in the planning of the project:	
Name:	
Affiliation:	
Address:	
Telephone:	
Fax:	
Email:	
Website (for CV and photo):	

2. Description of Project

2.1 Nature and objectives of the project:

2.2 If designated as part of a larger scale project, then provide the name of the project and the organization responsible for coordinating the project:

2.3 Relevant previous or future research projects:

2.4 Previous publications relating to the project:

3. Geographical Areas

3.1 Indicate geographical areas in which the project is to be conducted (with reference in latitude and longitude, including coordinates of cruise track/way points)

3.2 Attach chart(s) at an appropriate scale (1 page, high-resolution) showing the geographical areas of the intended work and, as far as practicable, the location and depth of sampling stations, the tracks of survey lines, and the locations of installations and equipment.

4. Methods and means to be used

4.1 Particulars of vessel:	
Name:	
Type/Class:	
Nationality (Flag State):	
Identification Number (IMO/Lloyds No.):	
Website for diagram & specifications:	
Owner:	
Operator:	
Overall length (meters):	
Maximum draught (meters):	
Displacement/Gross tonnage:	
Propulsion:	
Cruising & maximum speed:	
Call sign:	
INMARSAT number and method and capability of communication (including emergency frequencies):	
Name of master:	
Number of crew:	
Number of scientists on board:	
Relevant documents required by international conventions and regulations:	
Other relevant information:	
4.2 Particulars of aircraft:	
Name:	
Make/model:	
Nationality (Flag state):	
Website for diagram & specifications:	

Owner:	
Operator:	
Overall length (meters):	
Propulsion:	
Cruising & Maximum speed:	
Registration No.:	
Call sign:	
Method and capability of communication (including emergency frequencies):	
Name of pilot:	
Number of crew:	
Number of scientists on board:	
Details of sensor packages:	
Other relevant information:	

4.3 Particulars of Autonomous Underwater Vehicle (AUV):

Name:	
Manufacturer and make/model:	
Nationality (Flag state):	
Website for diagram & specifications:	
Owner:	
Operator:	
Overall length (meters):	
Displacement/Gross tonnage:	
Cruising & Maximum speed:	
Range/Endurance:	
Method and capability of communication (including emergency frequencies):	
Details of sensor packages:	
Other relevant information:	

4.4 Other craft in the project, including its use:

4.5 Particulars of methods and scientific instruments

Types of samples and measurements:	Methods to be used:	Instruments to be used:

4.6 Indicate nature and quantity of substances to be released into the marine environment:

4.7 Indicate whether drilling will be carried out. If yes, please specify:

4.8 Indicate whether explosives will be used. If yes, please specify type and trade name, chemical content, depth of trade class and stowage, size, depth of detonation, frequency of detonation, and position in latitude and longitude:

5. Installations and Equipment

Details of installations and equipment (including dates of laying, servicing, method and anticipated timeframe for recovery, as far as possible exact locations and depth, and measurements):

6. Dates

6.1 Expected dates of first entry into and final departure from the research area by the research vessel and/or other platforms:

6.2 Indicate if multiple entries are expected:

7. Port calls

7.1 Dates and names of intended ports of call:

7.2 Any special logistical requirements at ports of call:

7.3 Name/address/telephone of shipping agent (if available):

8. Participation of the representative of the coastal State

8.1 Modalities of the participation of the representative of the coastal State in the research project:

8.2 Proposed dates and ports for embarkation/disembarkation:

9. Access to data, samples and research results

9.1 Expected dates of submission to coastal State of preliminary report, which should include the expected dates of submission of the data and research results:

9.2 Anticipated dates of submission to the coastal State of the final report:

9.3 Proposed means for access by coastal State to data (including format) and samples:

9.4 Proposed means to provide coastal State with assessment of data, samples and research results:

9.5 Proposed means to provide assistance in assessment or interpretation of data, samples and research results:

9.6 Proposed means of making results internationally available:

10. Other permits submitted

10.1 Indicate other types of coastal state permits anticipated for this research (received or pending):

11. List of supporting documentation

11.1 List of attachments, such as additional forms required by the coastal State, etc.:

Signature:

Contact information of the focal point:

Name:

Country:

- Draft standard form B: Consent to conduct marine scientific research

Consent to conduct marine scientific research

(Complimentary opening)

...and has the honour to refer to (request document from Embassy) dated _____ regarding the proposed marine scientific research of (chief scientist). The Ministry is pleased to advise that approval has been given for the marine scientific research project (reference number of project) proposed in the (Territorial Sea/ Exclusive Economic Zone/Continental Shelf) of (coastal State) from (dates) to (dates) inclusive, subject to the conditions being met as specified below.

- Participation of (name and details of coastal State participant(s)).
- Notifications regarding entry into and departure from the (Territorial Sea/ Exclusive Economic Zone/Continental Shelf), port arrivals and departures, and daily position reports, should be transmitted to (provide channels through which such notifications are to be transmitted).
- Provision of preliminary report(s) within the time frame provided on application _____
- Access to all data and samples derived from the marine scientific research project, including provision of data to participant(s).
- Provision of data which may be copied and samples which may be divided and copies of reports prepared, or alternatively details of where such data and reports can be obtained will be submitted to _____ in a form acceptable to (coastal State) as soon as possible but preferably no later than a 12-month period after the conclusion of the proposed research programme. The information will be treated as public information and may be made available via the internet unless another arrangement is reached with the (coastal State) government.
- Assessment of data, samples and research results /or provision of assistance in such assessment or interpretation.
- Compliance with the attached guidelines (safety, acoustics, map of protected areas, list of relevant endangered species under CITES, etc.).
- Changes to the authorized research programme shall be directed to _____ (name, phone, email of Marine Scientific Research Office or focal point).
- Removal of the scientific research installations or equipment once the research is completed.
- Final report will be provided within a reasonable time-frame.

(Complimentary close)

Diplomatic Seal

ANNEX 9. BASIC SOCIOECONOMIC ASSESSMENTS TO SUPPORT COASTAL DEVELOPMENT PLANNING

A9.1. Introduction

A9.1.1. Socio-economic Conditions

Islands, such as Barbados, which include both land and sea interfaces, influence the fabric and design of the economies and welfare of the communities which depend, directly or indirectly, on the exploitation of the natural resources present on the island. This means that there are interrelationships between environmental and socioeconomic conditions prevailing in the both land and sea space. On one hand, socioeconomic conditions are usually affected by the natural environment with its various ecosystems which provide a continuous supply of goods including fish, oil, gas, minerals, salt, construction materials, and services including shoreline protection, sustaining bio-diversity, water quality maintenance, transportation, recreation and tourism. The socioeconomic structures on islands may affect, positively or negatively, the environment and its ecosystems by various human activities being conducted. This, in return, means that the stability of both the natural environment and the community welfare on islands are highly associated.

However, current growth and consumption patterns as well as unplanned development activities are placing increasing pressure on island ecosystems, causing a wide range of problems. Globally, it was estimated that, about two-thirds of the world's population live in coastal areas, and within three decades, 75 per cent of the world population will reside in coastal areas. These problems range between environmental degradation, biodiversity loss and deforestation, leading ultimately to the breakdown of socioeconomic systems. Such a pressure on coastal areas poses increasing threats to coastal ecosystems as they exceed the carrying capacity of these areas and leads usually to degradation of their resources and environmental quality in general (UNEP). This accordingly, emphasizes the need for sustainable development on islands. According to sustainable development, economic growth and environmental protection are viewed as mutually comparable activities and not conflicting ones. This in turn requires that various human activities must be integrated within a coherent setting of land-use planning policies, addressing problems of environmental carrying capacity. They also should be planned and developed within the limits of the local socioeconomic and natural carrying capacities.

A9.1.2. Objective of the Guide

Basically, the underlying purpose of this Guide is to provide conceptual and practical guidelines on how to conduct a reliable assessment of prevailing socioeconomic conditions for developmental proposal applications, in consistent format. It should be noted that the proposed consistent data collection and presentation format is intended to enable clear monitoring and evaluation to support State of the Coast reporting in the coming years and for improved data on socio-economic factors to be easily updated which in turn, may help the update of land use policies in the future.

A9.2. What is a Socio-economic Assessment?

A9.2.1. Definition and Purpose

The socio-economic environment refers to a wide range of diverse aspects and variables relating to or involving a combination of social and economic factors. These in general, can be categorized into several categories including, economic, demographic, public services, fiscal and social. The social aspects may, for instance, involve community island life as well as social and cultural attitude and values. Community services may meanwhile be concerned with housing and requirements for public services such as water, sanitation, communications, police and fire protection facilities, solid waste disposal as well as health and educational services. Demographic aspects may include population growth structures, distribution and density. Similarly, economic factors may include general characteristics, structures and changes various economic activities and employment.

A socioeconomic assessment is a way to learn about the social, cultural, economic and political conditions of stakeholders including individuals, groups, communities and organizations. The socioeconomic “situational analysis” is intended to:

- Assess the prevailing socioeconomic conditions. This includes provision of a baseline study and characterizing the existing state. This will assist in identifying the main areas of concern.
- Analyze the impacts of the prevailing environmental conditions on the socioeconomic structure of the proposed development area.
- Develop a set of guidelines for establishing viable communities.

Accordingly, the following section is concerned with listing all possible socioeconomic impacts and the indicators used to estimate their magnitude. This is followed by a general discussion of the methodology usually employed in conducting a socioeconomic analysis. Based on this methodology, an operational work plan is provided for the actual implementation of such socioeconomic analysis to be then used for insertion within future State of the Coast reports.

A9.2.2. Possible Socioeconomic Impacts

Generally, it should be stated that socioeconomic conditions are usually hard to identify and assess, as they are related to the human beings and their characteristics, which usually differ widely within the same community and from one community to another. Furthermore, as socioeconomic assessment deals with dynamic variables, no comprehensive list of areas of concern could be developed to fit socioeconomic assessment in all cases. However, there is a number of broad sets of socioeconomic impacts could be developed including economic impacts, demography; employment, health, and community resources including political, social, economic and cultural conditions (See Table 2.1).

Impact area	Indicators
Economic conditions	<ul style="list-style-type: none"> • Economic structure • Income levels • Job opportunities
Community structure, institution and infrastructure	<ul style="list-style-type: none"> • Health and social services in study area, including health, workforce, law enforcement, fire protection, water supply, wastewater treatment facilities, solidwaste collection and disposal, and utilities. • Transportation systems in study area, including highway, rail, air, and motorway • Tourism and recreational opportunities in the study site • Tax levels and patterns in the study area, including land, sales, and income taxes • Institutional structure • Community cohesion, including organized community groups • Social orders including community attitudes, lifestyle and history of the community • Distinct settlements of ethnic groups
Demographic conditions	<ul style="list-style-type: none"> • General trends in population size for study site • Migration trends in the study area • Population characteristics in the study area including distribution by age, gender, ethnic groups, educational level and family size • poverty and wealth distribution
Employment	<ul style="list-style-type: none"> • Employment composition • Unemployment rate • Availability of job opportunities and their nature
Gender	<ul style="list-style-type: none"> • Gender distribution • Employment structure • Role of women
Community resources	<ul style="list-style-type: none"> • Land use patterns and controls for study site • Land values in the study area • Housing characteristics in the study area, including types of housing and occupancy levels and age and condition of housing • Areas of unique significance

Table Annex 9.1: Indicators for socioeconomic impacts

A9.2.3. The Questions to Answer

The following questions may be used to help support CZMU to help coordinate the collection of information by other agencies. The questions refer to a “location” which is a loose term that may be used to relate to a specific geographic location (ICZM Plan Sub-Area), a sector or a new policy, plan or development proposal.

Economic Impacts:

- What are the main characteristics of the locations economic structure and how does it contribute to Barbados’ overall economic income?
- How does such an economic structure affect or be affected by the environmental quality of the location?
- How would local business be affected by rapid growth resulting from the development of the location?

Community structure, institutions, and infrastructure

- How are the locations communities organized, both formally and informally?
- What are the employment and economic dimensions of each social grouping?
- What are the existing economic, social, or cultural inequities among groups, if any, and what are their causes?
- What experience do various groups have with induced change?
- What changes in these variables may be caused by alternative scenarios for socio-economic development?
- What factors influence the daily lives of potentially affected members of the community?
- How stable is the pattern of residence?
- Do people in different groups feel that they currently have a satisfying way of life?
- What attitudes do people have toward risk, health, safety, and toward alternative scenarios for socio-economic development?
- How available are community services and infrastructure? And how will their provision and availability be affected in the future (i.e.: by climate change?).

Demography

- What are the demographic characteristics of the community? And to what extent are they affected by the prevailing environmental conditions?
- What is the current structure and organization of the population? Is it stable or changing?
- Are there ethnic, economic, or social group distinctions within this population?
- What are the patterns of poverty and wealth, and income distribution among the population?

Employment

- What is the existing employment composition?

- What is the magnitude and composition of the unemployed?
- What are the types and characteristics of primary and secondary job opportunities that are expected to be created?
- Are there seasonal changes, or other kinds of influx and outflow?

Gender

- What is the existing gender distribution of the population?
- What is the existing gender structure of employment and unemployment?
- What are the social and economic roles played by women in the community?
- What is the role of women, if any, in the existing decision making system?
- How are power and authority distributed in the community, both formally and informally?
- Who are the relevant stakeholders? What are their interests?
- How do they organize and exercise power within the community and at the regional and national levels?

Community Resources

- How do people use the land, whether urban or rural? Are there conflicts between these different land uses?
- How do they use the natural environment (land and reef area)?
- Are there culturally valued neighbourhoods, shopping areas, recreational areas, or gathering places?
- Are there culturally valued patterns of social formal and/or informal groups?
- Are there valued historic places, archaeological sites, or historical artifacts?

A9.3. Recommended Approach

For a socioeconomic “profile” to be organized and conducted properly, it should be systematic, and have minimum bias, and allow for consistent comparison and reasoned judgment. For all this to be accomplished, carefully planned, very precise and logical work methodologies are usually developed. The approach consists of three main sections as shown in Figure 3.1.

A9.3.1. Location Profiling

The first section aims to provide a comprehensive profile for the location and develop criteria for socioeconomic assessment. This could be attained through developing a thorough background about both coastal areas considerations and socioeconomic assessment.

A9.3.2. Conducting New Assessments

The second section deals with conducting the island socioeconomic assessment, which begins with the identification of main issues at the location and followed by identification of main positive and negative socioeconomic aspects.

Listing Impacts

Criteria for socioeconomic assessment should be firstly developed. The development of such criteria should be based on the list of socioeconomic impacts and indicators. However, the specific features of each location should be carefully taken into account in listing all possible impacts areas. The socioeconomic assessment should identify all possible impacts. In order to take account of all possible impacts, there is a number of “Impact identification” approaches (methods) including:

- Checklists.
- Matrices
- Networks
- Overlays and geographical information systems (GIS)

Each of the above-mentioned methods has their own advantages and disadvantages. However, the suitable method should be carefully selected. The choice of impact identification methods depends upon the type of impacts being considered, the nature of the likely impacts and the experience of the staff.

Scoping of Impacts

As the number of potential impacts on any location is usually large, socioeconomic impacts should be scoped to focus on the most important impacts, both direct, and indirect. Scoping is carried out by identifying and assigning priority to socioeconomic impacts that might be examined within the context of the socioeconomic assessment.

Scoping must be carried out in consultation with the affected groups and through the public participation process, should be based on discussions of an agreed policy, goal, vision or scenario for the future. Parameters to consider may include:

- Number of people potentially affected;
- Duration of potential impacts;
- Values of benefits and costs to affected groups;
- Potential for reversibility or mitigation;
- Likelihood of subsequent impacts;
- Relevance to decisions;
- Uncertainties over probable effects;
- Controversy.

A9.3.3. Provide Guidelines

Field Surveys

It should be borne in mind that the implementation of the socioeconomic study involves a number of field work activities, which include field surveys to acquire data and information from primary sources. This data and information is mainly concerned with personal opinions, which cannot be obtained from secondary sources such as perceptions and opinions of the individuals about their concerns and future perspectives of the island. They will also be utilized in the verification of data and information obtained from secondary sources.

Depending upon the objective of the field survey, the techniques of data collection should be determined. Generally, there is a wide range of techniques for data and information collection from primary sources including personal interview, telephone interview and mailed questionnaire. This means that the procedures and output of these techniques should be reliable and well-adopted to the case in hand.

Considerable amounts of fieldwork with different population groups would require careful consideration of the right approaches; which include for example, social surveys, questionnaires, interviews, use of available statistics, the Delphi technique. This would require recognition and understanding of the relationships of peoples' perceptions, their realities and the structures within which they exist. The ultimate objective is not only to obtain the required data and information but also to get them involved in the assessment process. This means that the objectives of the field survey should be clearly identified, which is the first step of conducting a successful field survey.

Questionnaires

Concerning the questionnaire forms to be employed in such field surveys, they should be developed carefully taking into account a number of considerations which may include the following:

- The questions should be easily understood by all individuals of the sample whatever their educational and cultural levels.
- The questions should be formulated to be accurately and clearly answered. This can be done through minimizing the open answer questions.
- The questions should be ordered so that the difficult and sensitive questions come later.
- The sensitive questions should be asked indirectly and their answers should be verified.

In order to ensure that the questionnaire is properly designed a pilot survey should be conducted with a feedback on the quality of questions, especially the difficult ones to understand ones. The pilot survey will include a number of questions, at the end of the primarily questionnaire to assess the reaction of those interviewed.

The outcome of this pilot survey will assist to review the questionnaire, and make adjustments, where needed. At this stage, the final questionnaire form will be ready and can be used to collect data and information. The form of survey to be conducted will depend upon direct interviews with the people in order to ensure high rate of response. It also helps to ensure the seriousness of the answers given by the interviewees. Moreover, the sensitivity of some questions and the need for clear, sharp and explicit answers to some questions compel the need for personal interview approach.

Also, as a result of the impossibility of investigating all the islands population, sampling methods will be useful to acquire data and information to save time, effort and fund. To ensure the representative of the sample, the sampling should be random. This will ensure that different socioeconomic groups are included in the sample. The best representativeness of the sample for the population can be considered as a function of sample size and sampling method. This means that the pre-determination of the sample size is meaningless. So the decision of the sample size should be taken during the carrying out of the survey, taking into account time, effort and fund limitations.

Involving Community Leaders

It should be noted that the involvement of communities' leader is of great importance to ensure the contacts with the target sample. Since the most socioeconomic aspects of the environment, and their magnitudes, exist largely in people's minds, interaction with affected communities and groups is essential. There are many methods of interacting with people and groups to learn about their society. A systematic interview program, working with group leaders and participant observation (in which the analyst lives as part of the community while studying how it works) are among the methods that can be employed. Still, the choice of methods will necessarily reflect not only available time and funds, but also reflect the kind of community affected.

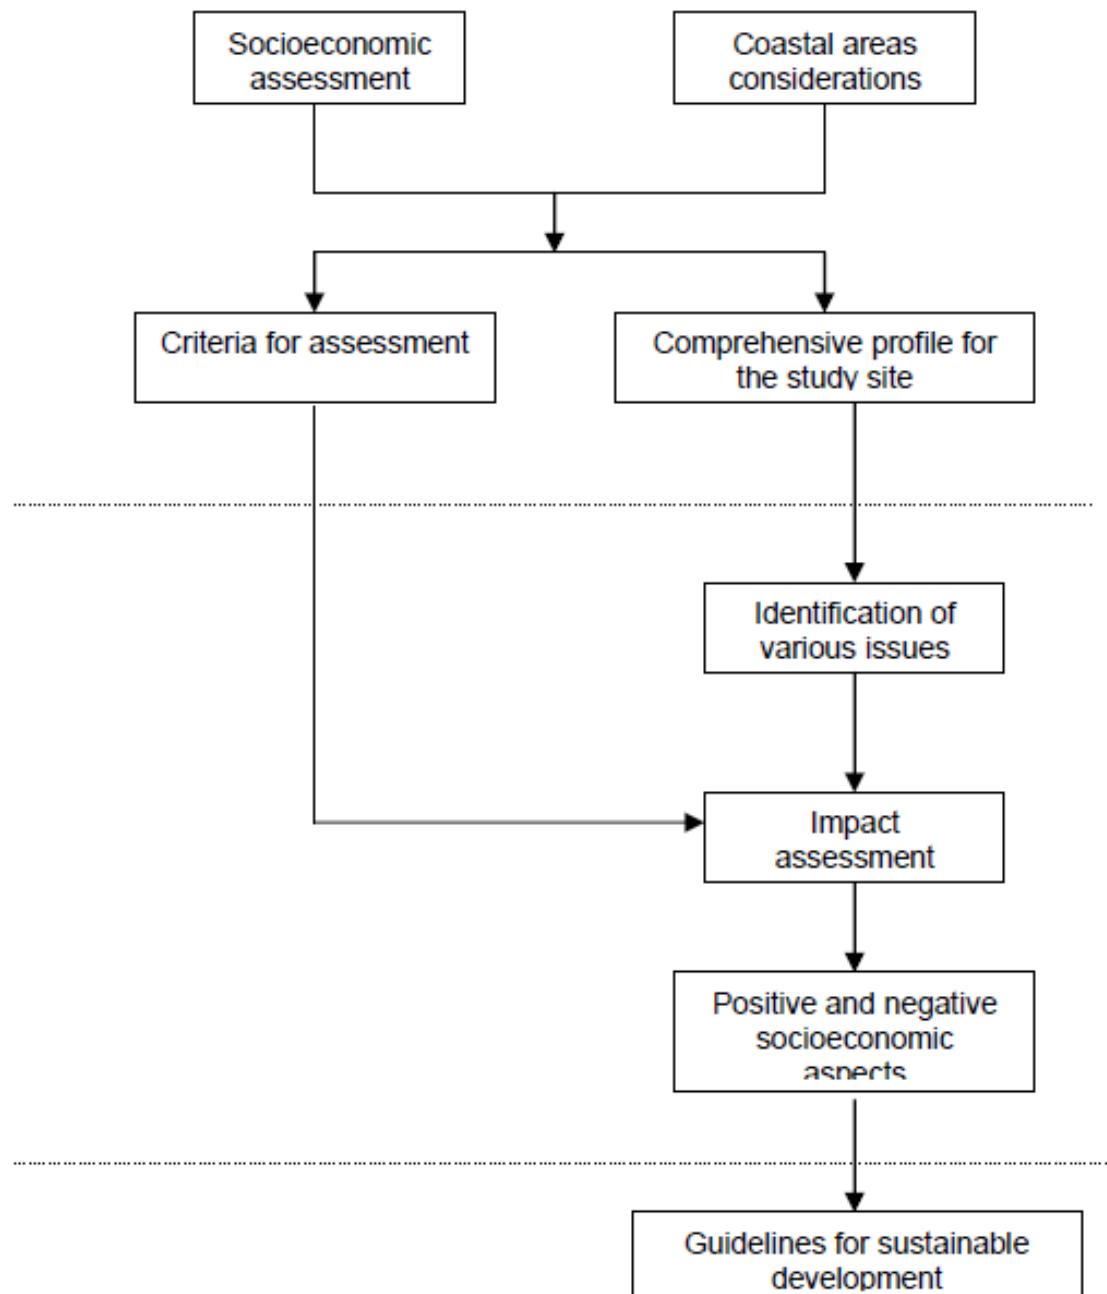

Figure Annex 9.1: Methodology for a Socioeconomic Study

A9.4. Work plan:

Based on the methodology presented above, a work plan for the socioeconomic study of any location should be developed to support future State of the Coast reporting. This work plan needs to include the following tasks and activities (Figure 4.1):

A9.4.1. Develop baseline conditions

This section can be considered as a preparatory work which includes the following steps:

Data and information collection from secondary sources

Materials; including statistics, research work, study reports, that may provide data and information about conditions in the island, have to be reviewed. This includes available data and information about various socioeconomic aspects, environmental quality and previous as well as current development schemes. It should be noted that various socioeconomic aspects of the location, have to be considered comprehensively without any bias towards any of the aspect.

As Census data is relatively inexpensive and highly reliable, Census represents one of the main secondary sources of data and information. Nevertheless, there should be certain problems that are generally associated with the use of data collected from secondary sources in general and census data in particular. These problems generally are related to:

- Changes in classification way of data and definitions of variables.
- Changes in boundaries of administrative units.

Therefore, these two issues should be taken into account in dealing with data from secondary sources

Develop a comprehensive profile

Depending upon the data and information that are collected from secondary sources, a comprehensive profile could be developed. The comprehensive profile should cover the following items:

- Boundaries of the island
- Past and present :
 1. Demographic structure.
 2. The economic structure.
 3. Social structure.
 4. Infrastructure provision.
- Development schemes in the island, past, present and future.

Usually, such a comprehensive profile is of great importance for the following steps of the study as it highlights the character and the main features of the island.

Develop a set of criteria for assessment

A comprehensive list of all possible socioeconomic impacts and indicators should be developed, based on the provisional list described before in the Guide. Thereafter, these impacts should be scoped to focus on the most important impacts to be dealt with within the context of the socioeconomic assessment.

A9.4.2. Field work

The field work (if required or deemed necessary) would involve the following steps:

Identify required data and information

After scoping, the data and information from secondary sources about the location and the previous development schemes should be reviewed to identify the gap of information to be collected from primary sources.

Conducting field surveys

After the identification of gaps in the required data and information, field surveys would be planned. This would require also the identification of the target population and sampling techniques.

A9.4.1.1. Designing a questionnaire form

Such a questionnaire will have to be designed in such a way that takes into account the type of people to be covered by the survey, in terms of educational status, culture, and attitude. This aspect is very important in order to end up with the right answers needed for this research work and avoid any possible biases.

A9.4.1.2. Pilot survey and feedback

In order to ensure the effectiveness and adequacy of the designed questionnaire forms, pilot survey would be conducted. The main objectives of conducting these pilot surveys is to fine tune them to attain their objectives most effectively.

A9.4.3. Data analysis and socioeconomic assessment

This section of the socioeconomic study will include the socioeconomic assessment of the island depending upon the analysis of the data and information collected from primary and secondary sources.

Data entry and verification

Dealing with large amount of data requires a systematic approach for data coding, tabulating and entry. It should be noted that, before data entry, the collected data should be verified. Such verification could be carried out for all collected data or for the random sample of the data. This depends usually on the quality of the procedures of data collection.

Data analysis

Analysis will involve standard statistical analysis of the data and information collected. The analysis should be based upon the criteria developed before.

Socioeconomic impacts assessment and identification of main areas of concern

One of the main objectives of socioeconomic assessment is to identify various socioeconomic positive and negative impacts. The socioeconomic impacts assessment should highlights possible relationships between assessed socioeconomic variables and the environmental quality in the island. Such an assessment could guide the following step of the work. Also, the areas of concern (issues and opportunities) of socioeconomic structure of the location have to be identified.

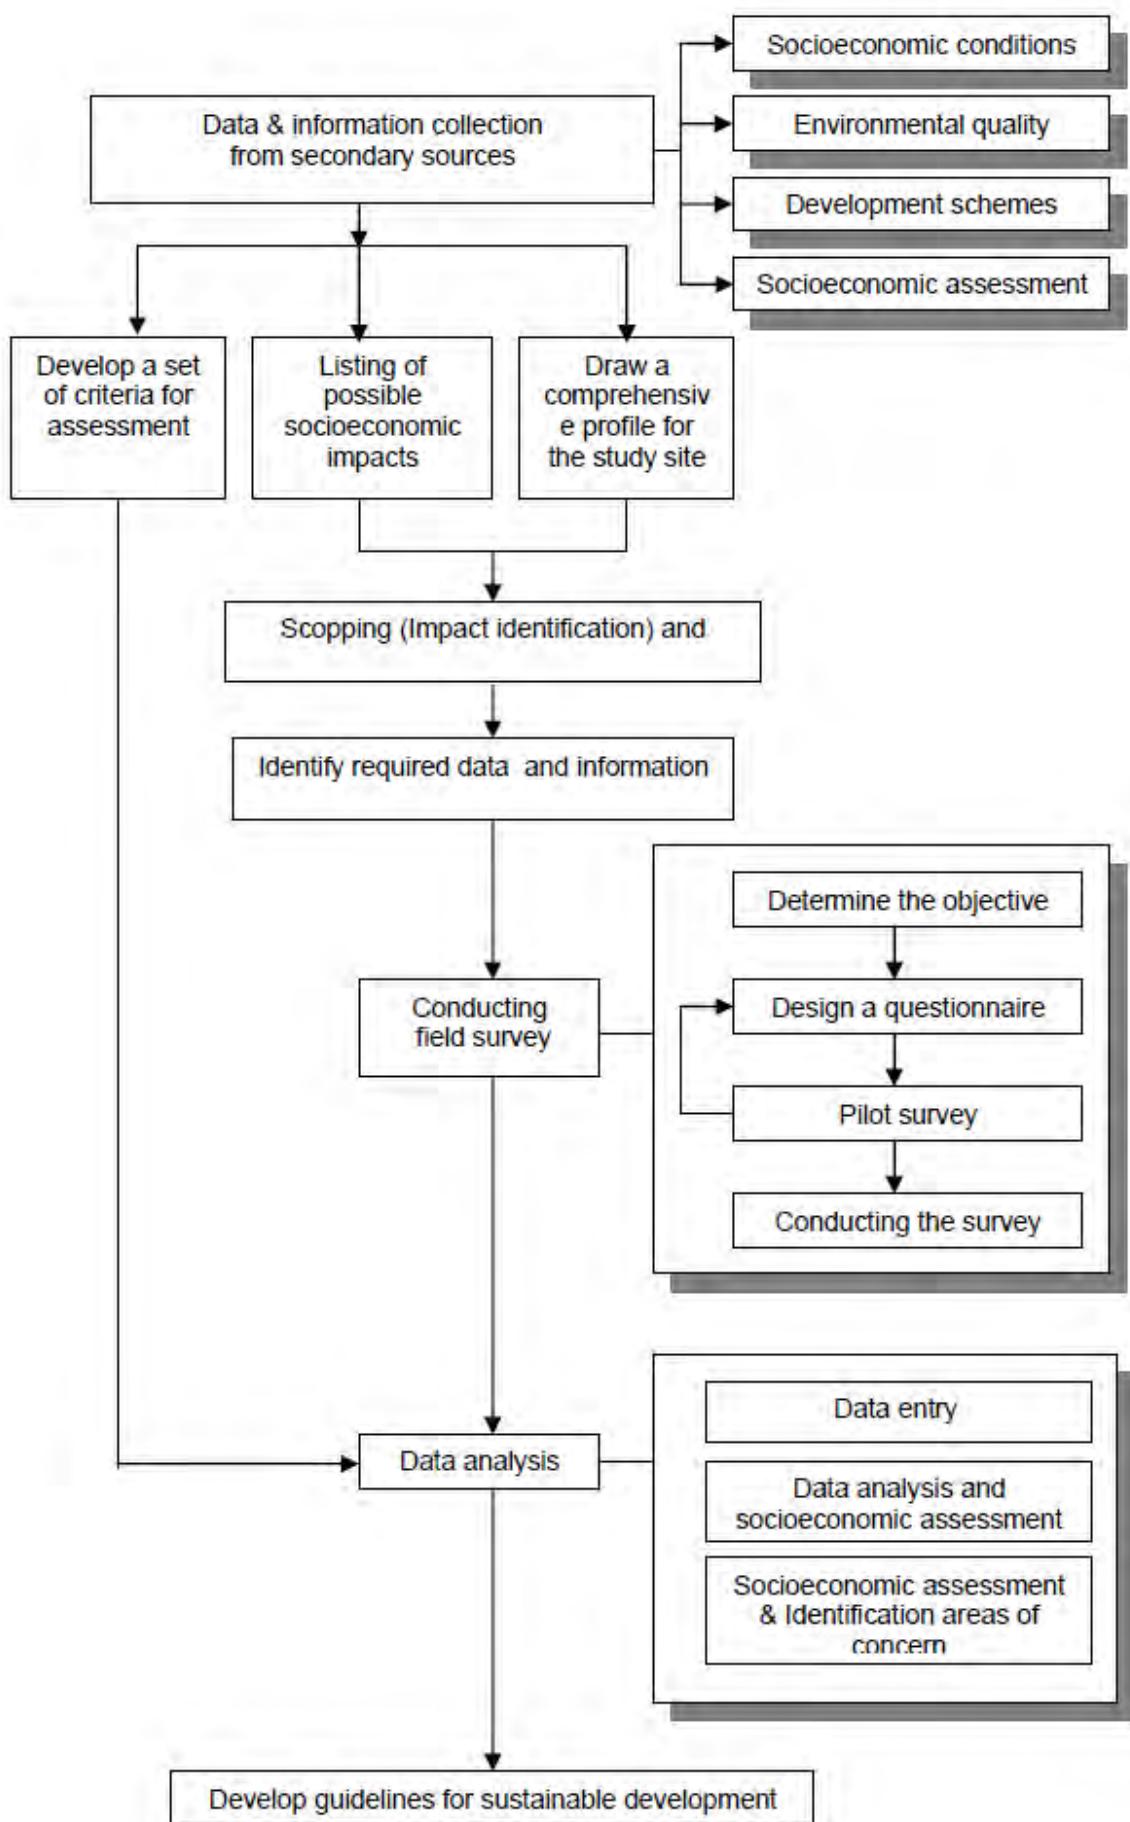

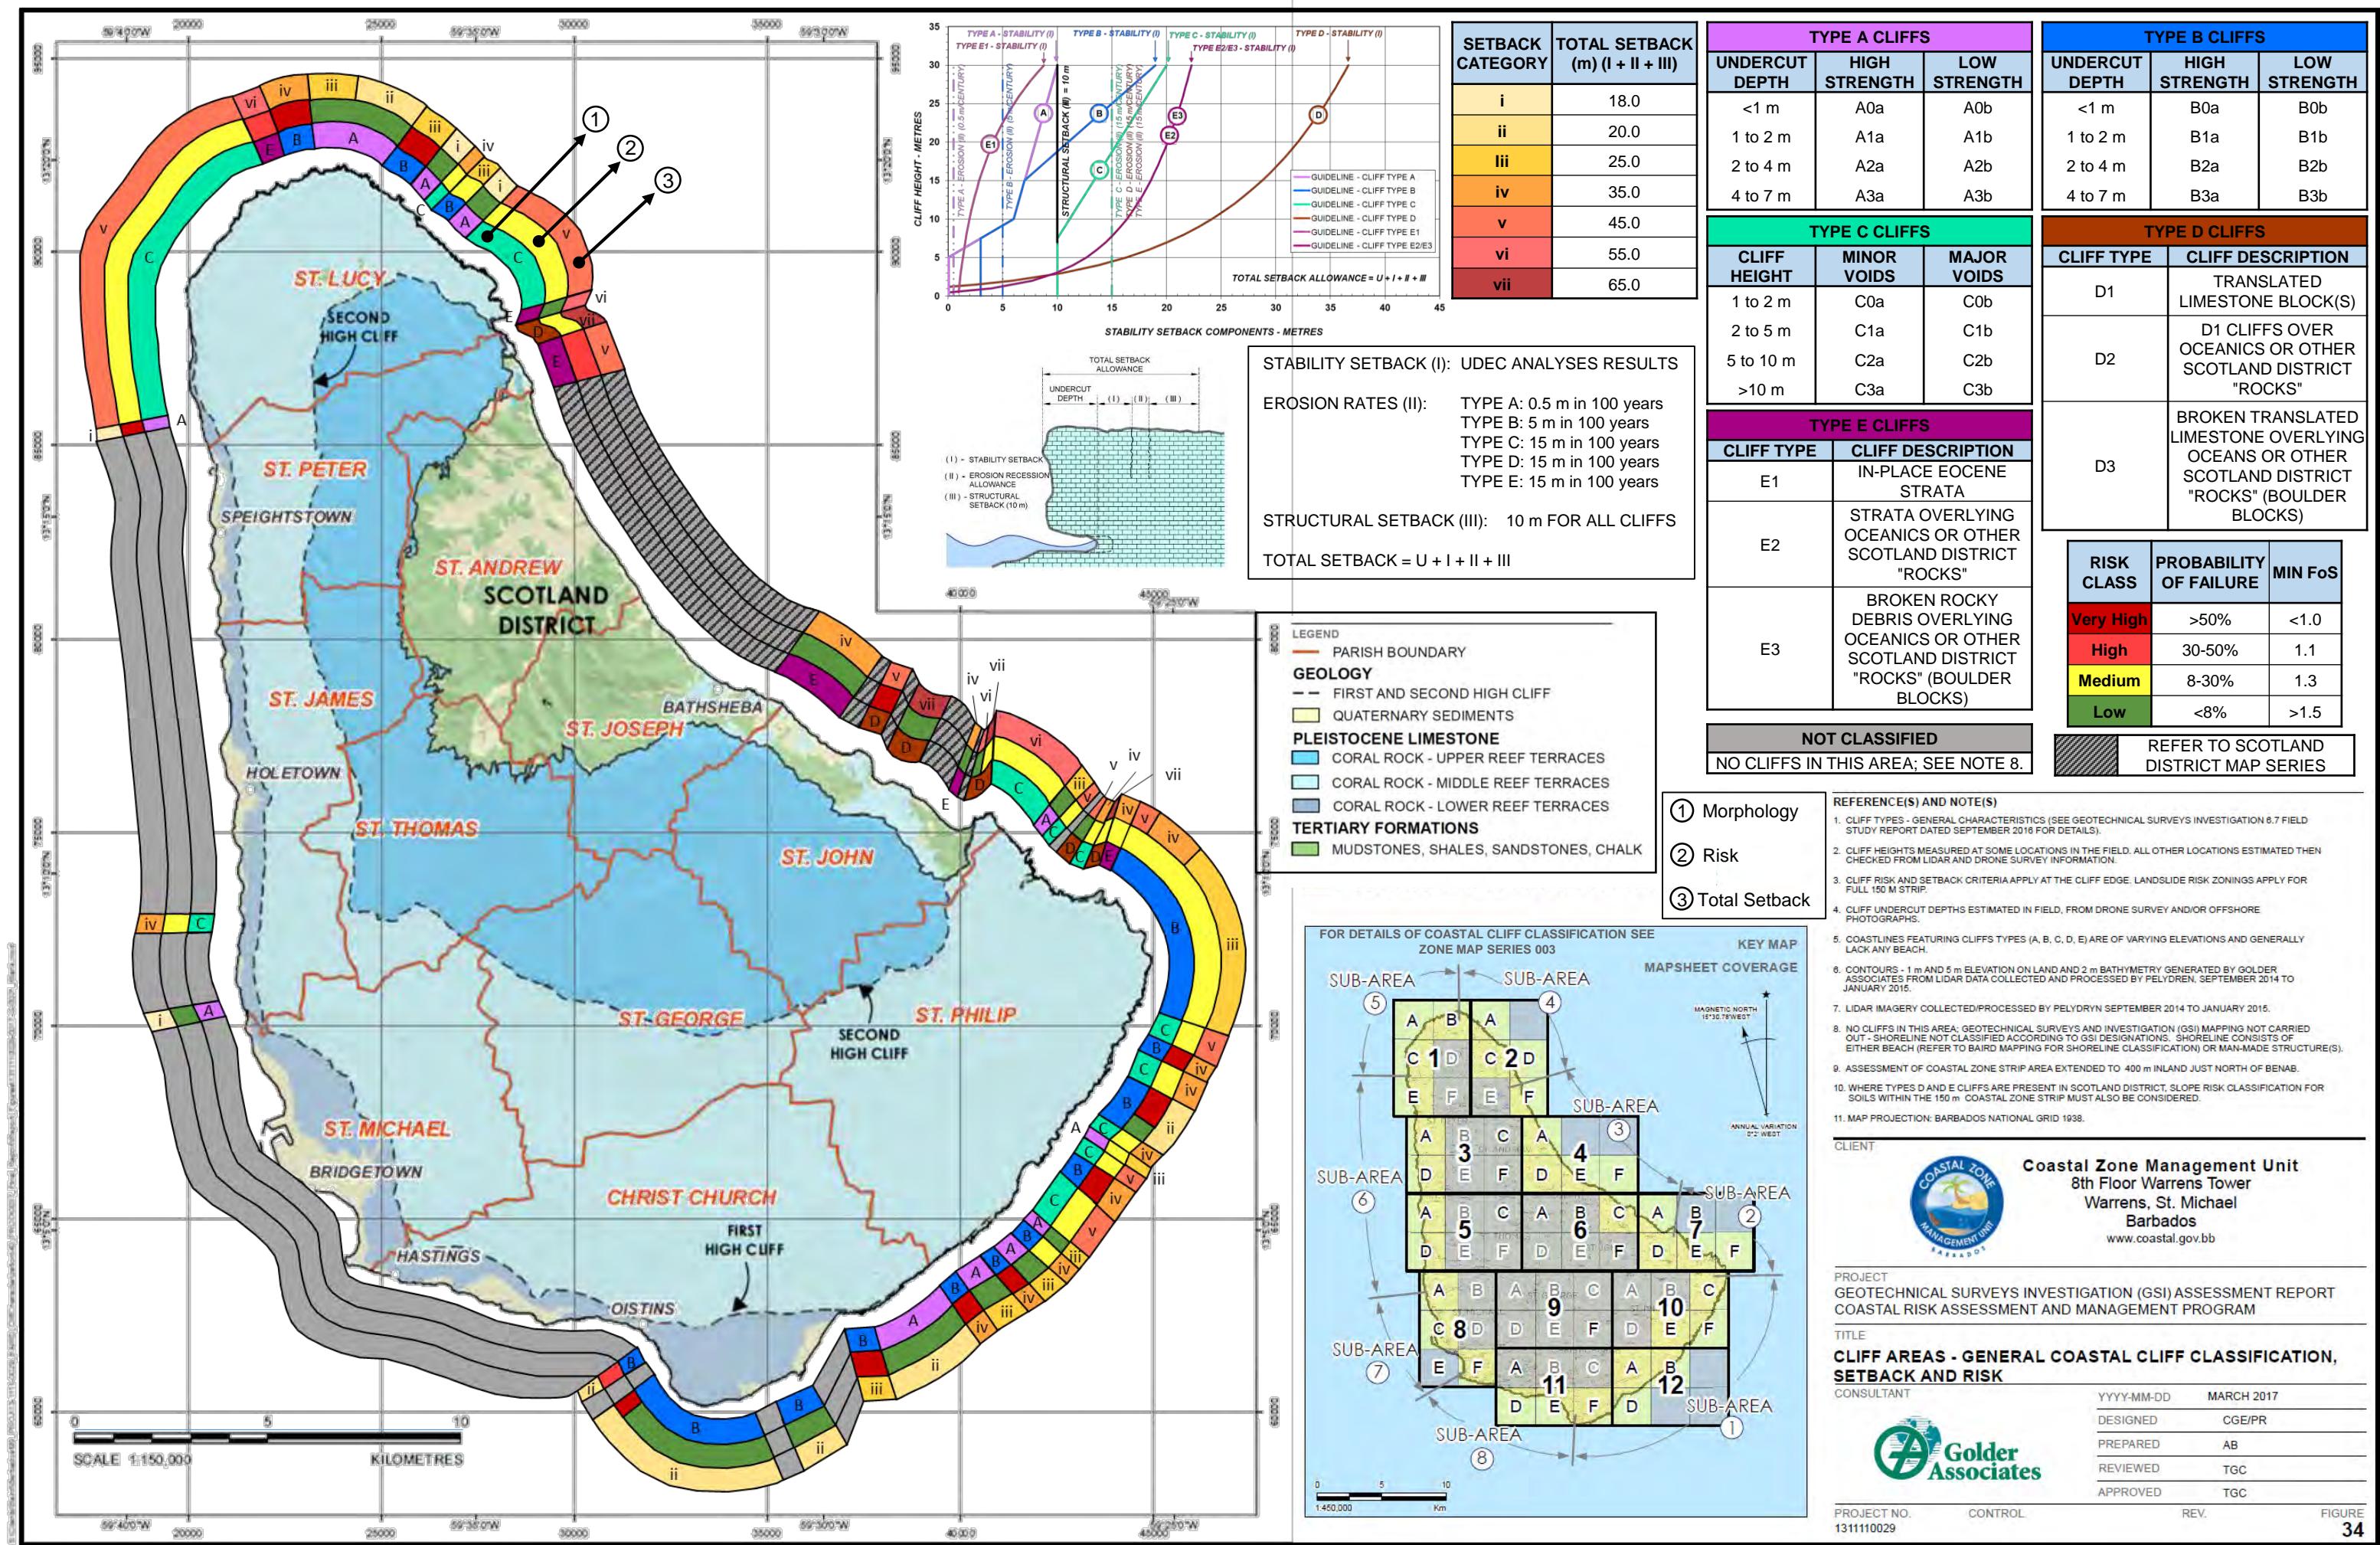

Figure Annex 9.2: Proposed WorkPlan of a Socioeconomic study

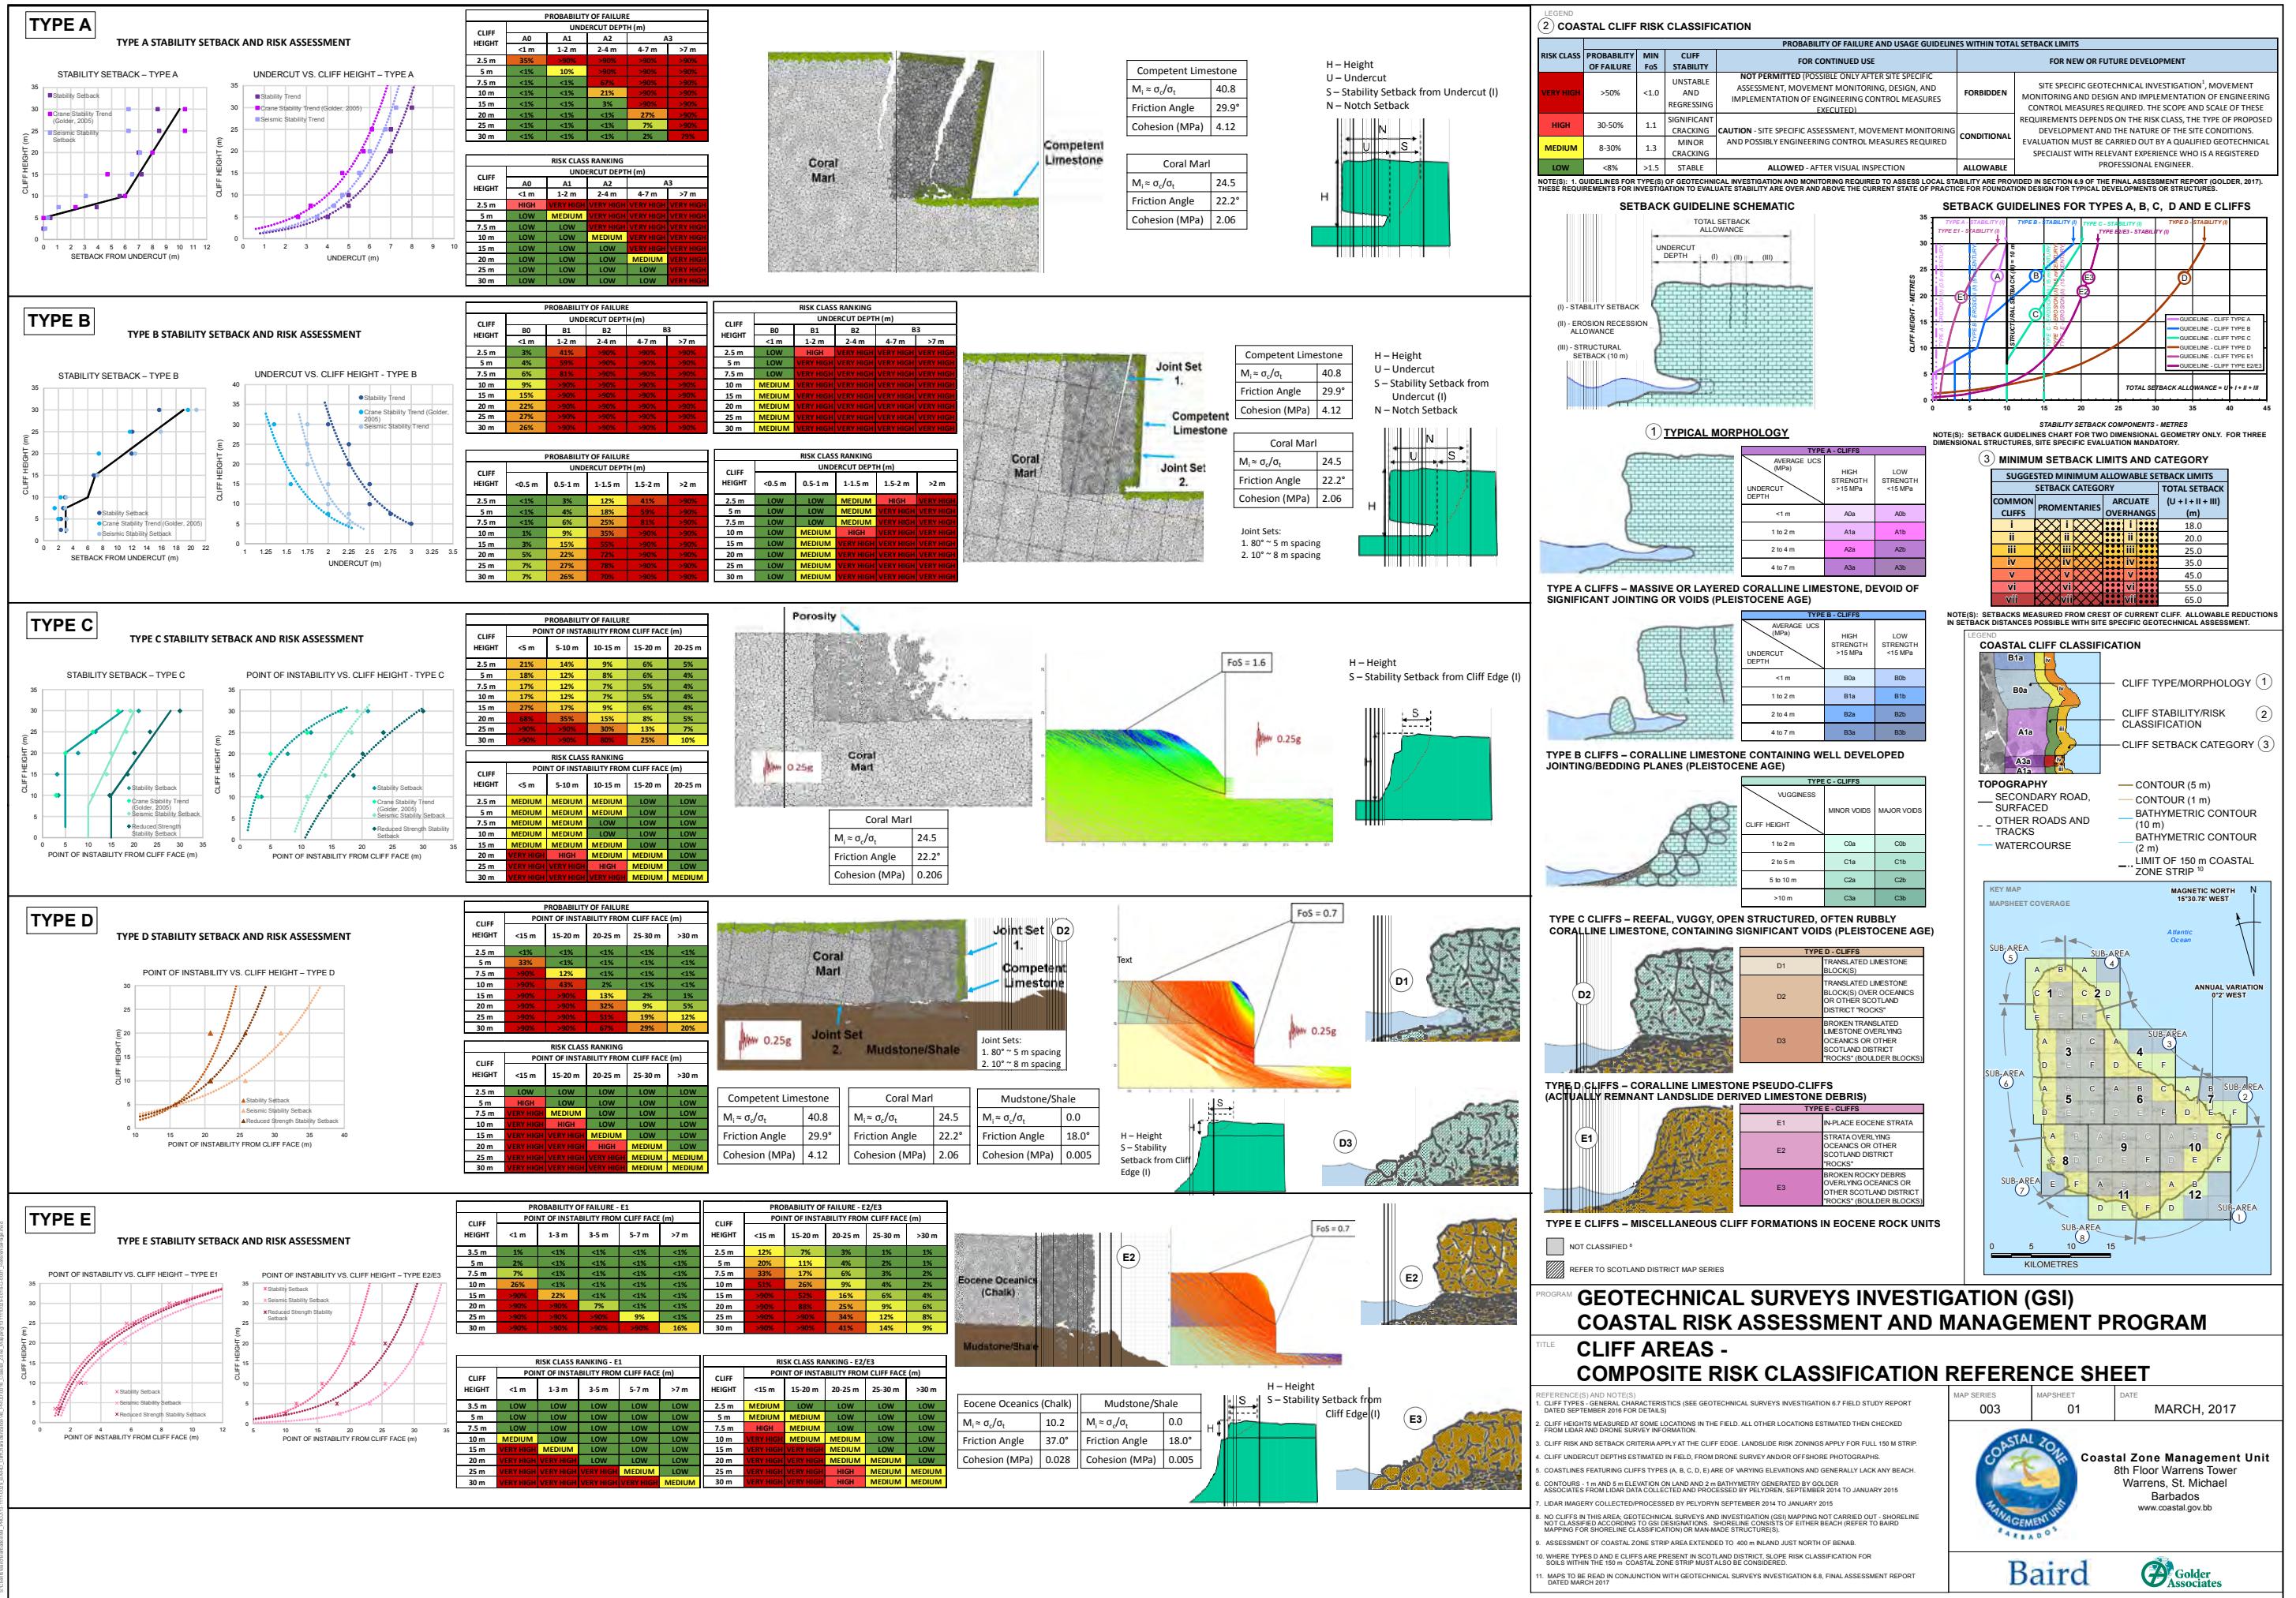

ANNEX 10. COASTAL CLIFF CLASSIFICATION, SETBACK AND RISK FROM GSI STUDY

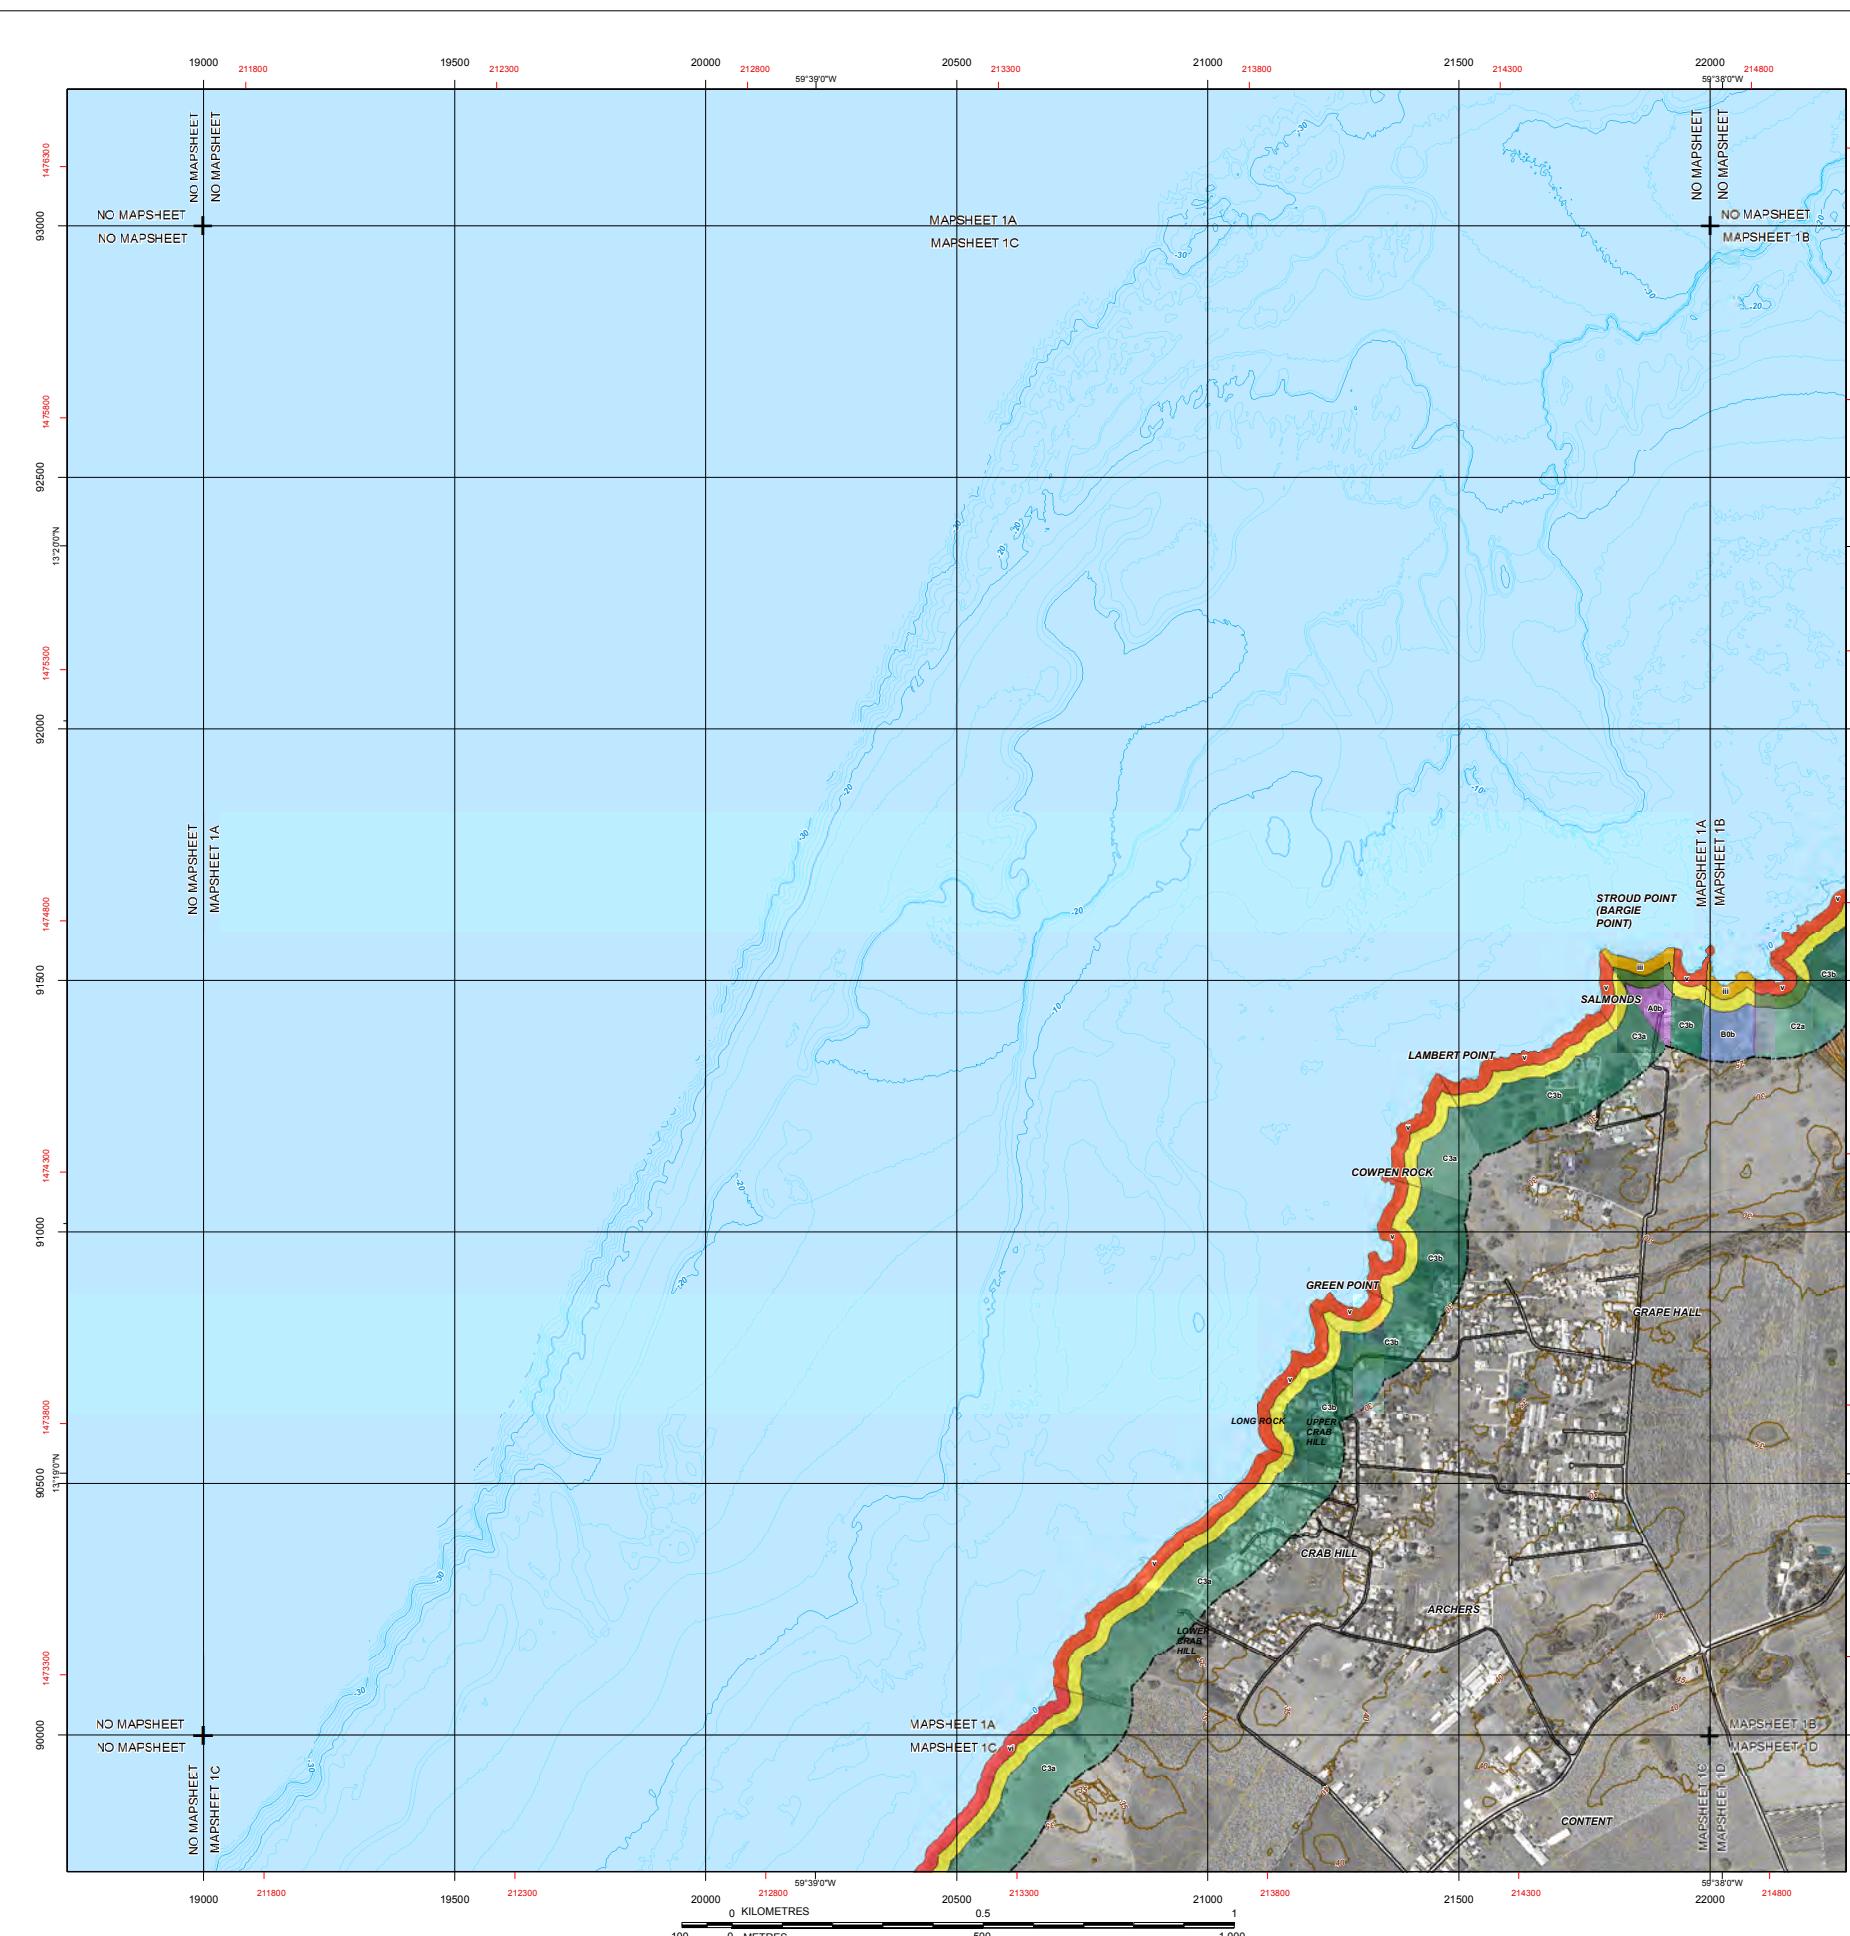

This Annex provides information extracted from the Geotechnical Survey Investigation (GSI) study (Golder Associates 2017), including:

- First, a set of maps including (i) a national map that represents the coastal cliff classification, setback and risk along the coast of Barbados; and (ii) the Coastal Cliff Classification Map Series 003 (extracted from Appendix R of GSI report) with local scale maps showing the extent of cliff setbacks.
- Finally, the guidelines for development in cliff areas around the island (extracted from section 6.9 of the GSI report).

A10.1. Maps: coastal cliff classification, setback and risk.

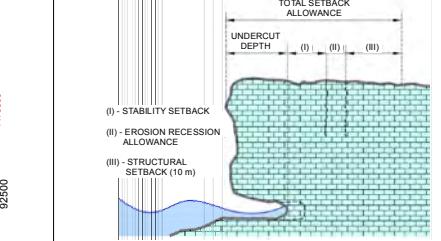

LEGEND ② COASTAL CLIFF RISK CLASSIFICATION

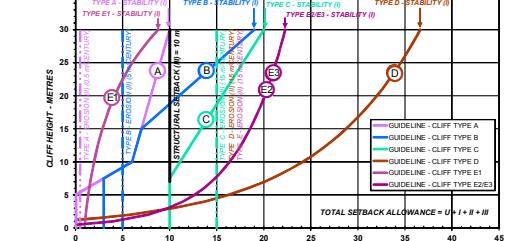

RISK CLASS	PROBABILITY OF FAILURE	MIN FoS	CLIFF STABILITY	PROBABILITY OF FAILURE AND USAGE GUIDELINES WITHIN TOTAL SETBACK LIMITS	
				FOR CONTINUED USE	FOR NEW OR FUTURE DEVELOPMENT
VERY HIGH	>50%	<1.0	UNSTABLE AND REGRESSING	NOT PERMITTED (POSSIBLY ONLY AFTER SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING, DESIGN, AND IMPLEMENTATION OF ENGINEERING CONTROL MEASURES EXECUTED)	FORBIDDEN
HIGH	30-50%	1.1	SIGNIFICANT CRACKING	CAUTION - SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING AND POSSIBLY ENGINEERING CONTROL MEASURES REQUIRED	CONDITIONAL
MEDIUM	8-30%	1.3	MINOR CRACKING	NOT PERMITTED (POSSIBLY ONLY AFTER SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING AND POSSIBLY ENGINEERING CONTROL MEASURES REQUIRED)	CONDITIONAL
LOW	<8%	>1.5	STABLE	ALLOWED - AFTER VISUAL INSPECTION	ALLOWABLE

NOTE(S): 1. GUIDELINES FOR TYPE(S) OF GEOTECHNICAL INVESTIGATION AND MONITORING REQUIRED TO ASSESS LOCAL STABILITY ARE PROVIDED IN SECTION 6.9 OF THE FINAL ASSESSMENT REPORT (GOLDER, 2017). THESE REQUIREMENTS FOR INVESTIGATION TO EVALUATE STABILITY ARE OVER AND ABOVE THE CURRENT STATE OF PRACTICE FOR FOUNDATION DESIGN FOR TYPICAL DEVELOPMENTS OR STRUCTURES.

SETBACK GUIDELINE SCHEMATIC

SETBACK GUIDELINES FOR TYPES A, B, C, D AND E CLIFFS

STABILITY SETBACK COMPONENTS - METRES
NOTE(S): SETBACK GUIDELINES CHART FOR TWO DIMENSIONAL GEOMETRY ONLY. FOR THREE DIMENSIONAL STRUCTURES, SITE SPECIFIC EVALUATION MANDATORY.

③ MINIMUM SETBACK LIMITS AND CATEGORY

SUGGESTED MINIMUM ALLOWABLE SETBACK LIMITS		SETBACK CATEGORY	TOTAL SETBACK
COMMON CLIFFS	PROMONTORIES	ARCuate OVERHANGS	(U + I + II + III) (m)
I	I	I	18.0
II	II	II	20.0
III	III	III	25.0
IV	IV	IV	35.0
V	V	V	45.0
VI	VI	VI	55.0
VII	VII	VII	65.0

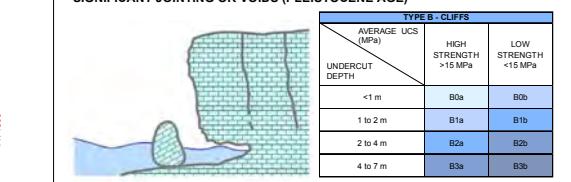

NOTE(S): SETBACKS MEASURED FROM CREST OF CURRENT CLIFF. ALLOWABLE REDUCTIONS IN SETBACK DISTANCES POSSIBLE WITH SITE SPECIFIC GEOTECHNICAL ASSESSMENT.

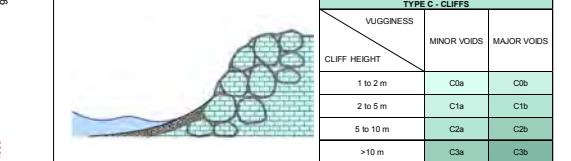

LEGEND
COASTAL CLIFF CLASSIFICATION

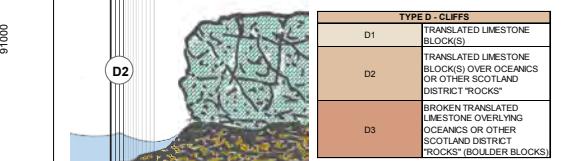

TYPE A CLIFFS - MASSIVE OR LAYERED CORALLINE LIMESTONE, DEVOID OF SIGNIFICANT JOINTING OR Voids (PLEISTOCENE AGE)

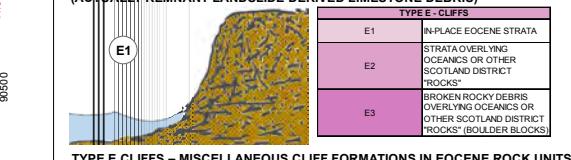

TYPE B CLIFFS - CORALLINE LIMESTONE CONTAINING WELL DEVELOPED JOINTING/BEDDING PLANES (PLEISTOCENE AGE)

TYPE C CLIFFS - REEFAL, VUGGY, OPEN STRUCTURED, OFTEN RUBBLY CORALLINE LIMESTONE, CONTAINING SIGNIFICANT Voids (PLEISTOCENE AGE)

TYPE D CLIFFS - CORALLINE LIMESTONE PSEUDO-CLIFFS (ACTUALLY REMNANT LANDSLIDE DERIVED LIMESTONE DEBRIS)

TYPE E CLIFFS - MISCELLANEOUS CLIFF FORMATIONS IN EOCENE ROCK UNITS

PROGRAM GEOTECHNICAL SURVEYS INVESTIGATION (GSI) COASTAL RISK ASSESSMENT AND MANAGEMENT PROGRAM

LEGEND ② COASTAL CLIFF RISK CLASSIFICATION

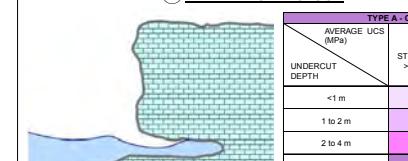

RISK CLASS	PROBABILITY OF FAILURE	MIN FoS	CLIFF STABILITY	PROBABILITY OF FAILURE AND USAGE GUIDELINES WITHIN TOTAL SETBACK LIMITS	
				FOR CONTINUED USE	FOR NEW OR FUTURE DEVELOPMENT
VERY HIGH	>50%	<1.0	UNSTABLE AND REGRESSING	NOT PERMITTED (POSSIBLY ONLY AFTER SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING, DESIGN, AND IMPLEMENTATION OF ENGINEERING CONTROL MEASURES EXECUTED)	FORBIDDEN
HIGH	30-50%	1.1	SIGNIFICANT CRACKING	CAUTION - SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING AND POSSIBLY ENGINEERING CONTROL MEASURES REQUIRED	CONDITIONAL
MEDIUM	8-30%	1.3	MINOR CRACKING	NOT PERMITTED ONLY AFTER SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING AND POSSIBLY ENGINEERING CONTROL MEASURES REQUIRED	CONDITIONAL
LOW	<8%	>1.5	STABLE	ALLOWED - AFTER VISUAL INSPECTION	ALLOWABLE

NOTE(S): 1. GUIDELINES FOR TYPE(S) OF GEOTECHNICAL INVESTIGATION AND MONITORING REQUIRED TO ASSESS LOCAL STABILITY ARE PROVIDED IN SECTION 6.8 OF THE FINAL ASSESSMENT REPORT (GOLDER, 2017). THESE REQUIREMENTS FOR INVESTIGATION TO EVALUATE STABILITY ARE OVER AND ABOVE THE CURRENT STATE OF PRACTICE FOR FOUNDATION DESIGN FOR TYPICAL DEVELOPMENTS OR STRUCTURES.

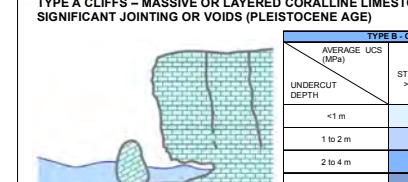

SETBACK GUIDELINE SCHEMATIC

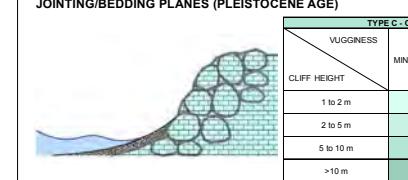

① TYPICAL MORPHOLOGY

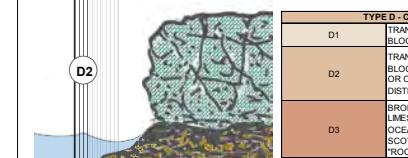

TYPE A CLIFFS – MASSIVE OR LAYERED CORALLINE LIMESTONE, DEVOID OF SIGNIFICANT JOINTING OR Voids (PLEISTOCENE AGE)

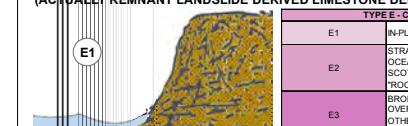

TYPE B CLIFFS – CORALLINE LIMESTONE CONTAINING WELL DEVELOPED JOINTING/BEDDING PLANES (PLEISTOCENE AGE)

TYPE C CLIFFS – REEFAL, VUGGY, OPEN STRUCTURED, OFTEN RUBBY CORALLINE LIMESTONE, CONTAINING SIGNIFICANT Voids (PLEISTOCENE AGE)

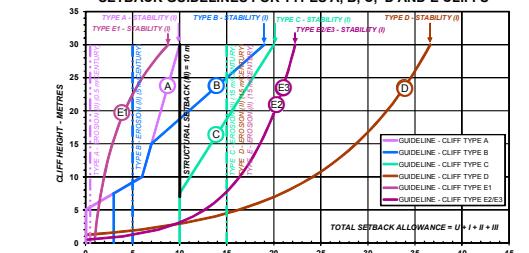

TYPE D CLIFFS – CORALLINE LIMESTONE PSEUDO-CLIFFS (ACTUALLY REMANT LANDSLIDE DERIVED LIMESTONE DEBRIS)

TYPE E CLIFFS – MISCELLANEOUS CLIFF FORMATIONS IN EOCENE ROCK UNITS

SETBACK GUIDELINES FOR TYPES A, B, C, D AND E CLIFFS

NOTE(S): SETBACK GUIDELINES CHART FOR TWO DIMENSIONAL GEOMETRY ONLY. FOR THREE DIMENSIONAL STRUCTURES, SITE SPECIFIC EVALUATION MANDATORY.

SUGGESTED MINIMUM ALLOWABLE SETBACK LIMITS		TOTAL SETBACK
SETBACK CATEGORY	COMMON CLIFFS	
PROMONTORIES	I	ARCuate Overhangs (U + I + II + III) (m)
II	II	18.0
III	III	20.0
IV	IV	25.0
V	V	35.0
VI	VI	45.0
VII	VII	55.0
	VI	65.0

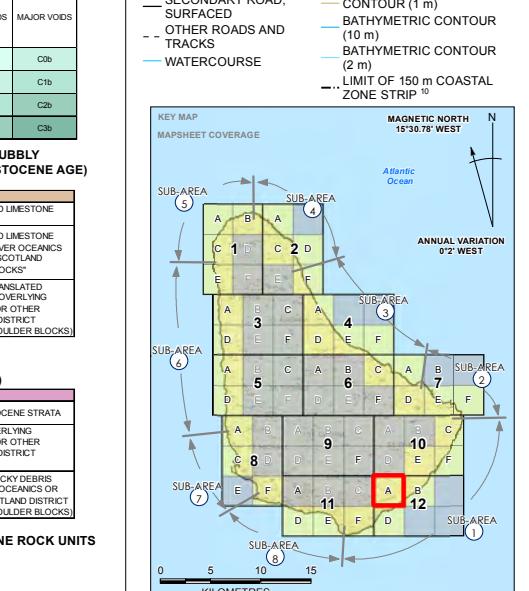

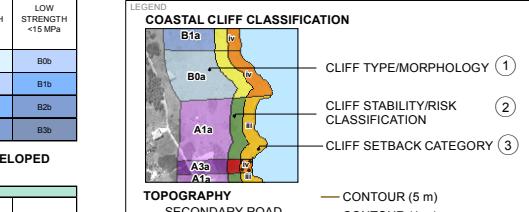

NOTE(S): SETBACKS MEASURED FROM CREST OF CURRENT CLIFF. ALLOWABLE REDUCTIONS IN SETBACK DISTANCES POSSIBLE WITH SITE SPECIFIC GEOTECHNICAL ASSESSMENT.

③ MINIMUM SETBACK LIMITS AND CATEGORY

SUGGESTED MINIMUM ALLOWABLE SETBACK LIMITS		TOTAL SETBACK
SETBACK CATEGORY	COMMON CLIFFS

A10.2. Guidelines for development

The following is intended to update and enhance the existing recommendations and form a new set of guidelines to be used to help review applications for future development and continued land use within the 150 m coastal zone strip within the Cliff areas around the island. These guidelines are based on the risk zoning presented in detail (at 1:5,000 scale) on the Map Series 003 and as summarized on the first figure of this Annex.

The guidelines for development and use within the coastal strip (summarized in the tables within the legend of these figures and the detailed Map Series 003) are discussed in the following sub-sections. The table of Guidelines for Development and Use shown on the following figure provides a summary of these guidelines and is also included as an inset on figures on each individual map sheet of the Map Series 003.

RISK CLASS	PROBABILITY OF FAILURE AND USAGE GUIDELINES WITHIN TOTAL SETBACK LIMITS					
	PROBABILITY OF FAILURE	MIN FoS	CLIFF STABILITY	FOR CONTINUED USE	FOR NEW OR FUTURE DEVELOPMENT	
VERY HIGH	>50%	<1.0	UNSTABLE AND REGRESSING	NOT PERMITTED (POSSIBLE ONLY AFTER SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING, DESIGN, AND IMPLEMENTATION OF ENGINEERING CONTROL MEASURES EXECUTED)	FORBIDDEN	SITE SPECIFIC GEOTECHNICAL INVESTIGATION ¹ , MOVEMENT MONITORING AND DESIGN AND IMPLEMENTATION OF ENGINEERING CONTROL MEASURES REQUIRED. THE SCOPE AND SCALE OF THESE REQUIREMENTS DEPENDS ON THE RISK CLASS, THE TYPE OF PROPOSED DEVELOPMENT AND THE NATURE OF THE SITE CONDITIONS. EVALUATION MUST BE CARRIED OUT BY A QUALIFIED GEOTECHNICAL SPECIALIST WITH RELEVANT EXPERIENCE WHO IS A REGISTERED PROFESSIONAL ENGINEER.
HIGH	30-50%	1.1	SIGNIFICANT CRACKING	CAUTION - SITE SPECIFIC ASSESSMENT, MOVEMENT MONITORING AND POSSIBLY ENGINEERING CONTROL MEASURES REQUIRED	CONDITIONAL	
MEDIUM	8-30%	1.3	MINOR CRACKING			
LOW	<8%	>1.5	STABLE	ALLOWED - AFTER VISUAL INSPECTION	ALLOWABLE	

NOTE(S):

1. GUIDELINES FOR TYPE(S) OF GEOTECHNICAL INVESTIGATION AND MONITORING REQUIRED TO ASSESS LOCAL STABILITY ARE PROVIDED IN SECTION 6.9 OF THE FINAL ASSESSMENT REPORT (GOLDER, 2017). THESE REQUIREMENTS FOR INVESTIGATION TO EVALUATE STABILITY ARE OVER AND ABOVE THE CURRENT STATE OF PRACTICE FOR FOUNDATION DESIGN FOR TYPICAL DEVELOPMENTS OR STRUCTURES.

In general, all new development should be located behind the minimum recommended total setback limits. Any development or structures (existing or proposed) that may encroach into the total setback limit will require specific evaluation to ensure that the loading from the structure(s) do not adversely affect the stability of the cliffs. All existing structures located within the total setback limits may incur restrictions on future use (including possibly eviction) depending on risk level and outcome of site specific geotechnical investigation and assessment as discussed below.

A10.2.1. Low Risk Areas

From a cliff stability perspective, areas within the coastal strip that are classified as low risk are generally considered to be stable. Future development and continued use of currently occupied properties should not be restricted (subject to adherence to the minimum recommended total setback requirements) and geotechnical investigations and/or monitoring are generally not anticipated to be necessary for locations outside of the total setback limits. For existing structures located within the total setback limits in low risk areas, continued use may be allowable, depending on proximity to cliff face, local conditions and subject to satisfactory inspections. New development within the total

setback limits in low risk areas would generally be allowable subject to geotechnical investigations (i.e. in addition to typical requirements as part of the current state of practice for foundation design for developments or structures) and assessment and monitoring by a qualified geotechnical specialist with proper structural design, if required.

A10.2.2. Medium Risk Areas

Areas within the coastal strip that are classified as medium risk are also generally considered to be stable from an overall stability perspective. New development and continued use of currently occupied properties should not necessarily be restricted (subject to adherence to the minimum recommended total setback requirements) however, caution is advised. Evidence and signs of incipient instability observed in certain parts of medium risk areas suggests that confirming stability and refining risk with respect to the extent and/or location of any existing or proposed development is required. For cases where existing structures are located, or new development is proposed to be located, within the recommended total setback allowance, geotechnical investigations (i.e. additional to typical requirements as part of the current state of practice for foundation design for developments or structures), assessment and monitoring by a qualified geotechnical specialist will be required. The scope of the investigation and assessment required (plus requirements for additional structural and/or remedial design measures) will be dependent on the scale of the existing or proposed development, and in particular on the location relative to the recommended total setback limit.

A10.2.3. High Risk Areas

Areas within the coastal strip that are classified as high risk are generally considered to be only marginally stable.

All existing structures and any proposed new development should be located beyond the recommended total setback limits. In high risk areas, existing buildings and infrastructure that are located within the minimum recommended total setback limits may be at high risk if cliff recession has created marginally stable overhangs or open joints in areas where joint controlled blocks are evident. For these situations and for cases where any new development is proposed to encroach into the recommended total setback limit, inspection, investigation and evaluation by a qualified geotechnical specialist is required. Evaluation should include a detailed assessment of each of the components for calculating/refining the minimum total setback requirement, including:

- Undercut (U) – refinement should be based on detailed survey of actual cliff and notch geometry at the site;
- Stability Component (I) – refinement should be based on detailed site specific investigation, sampling and laboratory testing followed by numerical analysis using actual cliff geometry (3D analysis may be required, depending on site geometry);
- Recession Component (II) – refinement should be based on assessment of actual recession/erosion rates at site, including consideration of shoreline protection, if any, typical wave climate and energy, and available long-term monitoring information (if any); and,
- Structural Component (III) – refinement should be based on actual site and structure conditions including cliff height, cliff type as well as building load(s) and foundation type(s) and depth(s).

Depending on the outcome, new development may not be permitted and, for existing structures, restrictions on continued land use, implementation of remedial measures, monitoring, or possibly eviction, may be mandatory. Ground movement and tension crack monitoring of identified features will be required for any continued use of existing structures and for any proposed new development. Such mandatory monitoring should be carried out to establish ground movement rates on an annual basis. Approval(s) for new development in these areas (within the total setback limits) would be dependent on the outcome of detailed investigation, assessment and monitoring and be subject to review by a qualified geotechnical specialist. However, in general, new development may be limited to only lightly loaded, low-level or single-storey building structures.

As a minimum requirement, all geotechnical investigations should be carried out by a qualified geotechnical specialist and the minimum investigation requirements to assess stability (in addition to that carried out as part of the current state of practice for foundation design for typical developments or structures) should include the following tasks:

- Detailed survey of topography and cliff geometry;
- Detailed cliff mapping followed by drillhole investigation to confirm cliff types and rockmass competence and variability, and presence or absence of unidentified deep undercuts, adverse jointing influence, blowholes, caves or adverse vuggy porosity;
- Laboratory testing of undisturbed samples of cap, face and internal fabric (direct tensile and Brazilian and uniaxial strength tests) to establish rock properties;
- Determination of Building Footprint and Loadings;
- Calculation of appropriate stability, recession and structural setbacks based on regression equations; and,
- Check comparison of results against the 1:5,000 scale setback maps in Appendices J and R and update as required.

Prior to approval for new development, the results of the detailed geotechnical investigation and assessment in the context of the scale of the proposed development should be reviewed by a qualified geotechnical professional.

A10.2.4. Very High Risk Areas

Areas within the coastal strip that are classified as very high risk are generally considered to be unstable within the total setback limits. Future development should therefore not be permitted within the setback zone as defined in these areas. The continued use of existing structures and infrastructure within the setback zone in these areas is also not permitted. The urgency and requirements for abandonment of existing infrastructure, design and implementation of remedial measures, and/or eviction from existing residential developments within the total setback limits however would need to be evaluated on a case-by-case basis. Mandatory evaluation must include a detailed re-assessment of each of the components involved in determining the minimum total setback required (as per the requirements outlined in previous section for the High Risk Areas).

In all areas where existing development is present, and where it is proposed that such development remain in place, a regular program of inspection, crack monitoring and structure movement monitoring should be immediately implemented. The results of such a program would then be used to identify and prioritize the requirements for abandonment, eviction, or implementation of remedial measures.

A10.2.5. Areas behind Total Setback Limit

In terms of the above discussions, the ‘setback limit’ or ‘setback strip’ applies to the Total Setback Distance and not just the Stability Setback (I) discussed under stability analysis. The stability setback constitutes just one portion of the Total Setback. The Total Setback is the combined value of the Undercut Depth (U) as well as the setbacks compiled from: (I) the Stability Setback Component calculated from the line of best fit for each cliff type; (II) the Recession Allowance Component; and, (III) the Structural Setback Width.

Ongoing and future use of cliff areas outside of the defined Total Setback distance, as far as the 150 m boundary, is permissible without remediation. However, if new development is proposed to be located close to the Total Setback boundary in any areas designated as high to very high risk (as explained in Section 6.7), it is advisable that the new development be subjected to site specific investigations (over and above that required as part of the current state of practice for typical foundation design). This additional, site specific investigation would be necessary to check that the proposed structure(s), foundation load(s), construction methods, etc. will not destabilize the cliff zone conditions or in any way adversely extend the pre-defined Total Setback distance further inland.

ANNEX 11. TIERED APPROACH TOWARDS ADDRESSING EMERGING ISSUES IN THE CZMA

A tiered approach to identifying and addressing emerging challenges (as directed by members of the Planning and Development Board) may include the following:

Analysing and applying approaches to identify possible emerging challenges

- Scan methods (enhanced by deep-analytics tools) to provide early detection of even weak signals or patterns.
- Undertake trend-analysis methods to better quantify data and review additional analytic tools for assessing unstructured data.
- Consider using future scenarios that use quantitative, qualitative, and unstructured data to fuel real-time and dynamic scenario imaging as data feeds are used to refine and weight potential outcomes.
- Adopt the use of crowdsourcing and analytics to detect and predict emerging challenges, particularly for hazardous natural or human-caused areas of concern.

Organizing and screening emerging challenges for further review

- Apply selected screening-level versions of the mature tools now available for each of the three main sustainability pillars (society/environment/economy)'.

Analyse the sustainability challenges of identified emerging issues

- Screening-level results should be used to help rank/order the importance or significance of emerging challenges taking place on the coast for further analysis. The most likely scenarios from the future methods should be subjected to a more detailed set of assessments for each of the three pillars as more refined data become available.
- Devise a systems-based indicator analysis of likely scenarios from the futures methods which could be used to further clarify which projects would benefit most from more refined sustainability assessments. (*NB: the sustainability-assessment tools and approaches will be informed and guided by emerging related issues that are identified and may include environmental-impact assessments, social impact assessments, benefit-cost analyses (BCAs), risk assessments, resilience and adaptation assessments, segmentation analyses, and collaborative problem-solving already in place for the ESIA process in Barbados*).

Communication of findings and recommendations

Social-media platforms and analytics present new and effective forums to engage and communicate with Barbadian stakeholders, allowing for the use of analytic approaches to provide rapid analysis and categorization of stakeholder input and to provide transparency to stakeholders on how CZMU uses this information in its decision-making. This approach presents an opportunity to derive a substantial increase in value from stakeholder processes that are planned for GoB and CZMU. Additional value could be created in the use of advanced IT capabilities in the following:

- Benchmarking the potential effects of newly identified emerging issues in the regulated community and other stakeholders.
- Mapping the effects of newly identified emerging issues in demographic or stakeholder categories.
- Setting priorities for action on newly identified emerging issues multiple stakeholder categories.
- Identifying the socially influential stakeholders to spearhead the communication of emerging issues to a broader citizenry.
- Assessing stakeholder preferences for sustainable and resilient products and technologies through analysis of social-media data.

In this instance, CZMU should develop its current IT capabilities to assess emerging issues by involving all relevant stakeholders, possibly through the use of a range of social analytic tools (see Section E4 “Information Needs and Data Management”). This could involve the incorporation of insights from a broad array of stakeholders which, upon evaluation, could markedly improve CZMU’s understanding of a new issue’s importance and also, the speed with which it is emerging. The insights could also improve the evidence base for the CZMU’s decision-making process and increase the likelihood of stakeholder acceptance of difficult decisions.

To enhance post-decision assessment of its activities, the GoB (under the leadership of the CZMU) should identify, track, and address unintended consequences of new emerging issues. A searchable database of the lessons learned should be created and possibly linked to NCRIPP to determine the implications of the emerging issue for coastal hazards and risks (see Section E4 “Information Needs and Data Management”).

Not only would that provide additional evidence-based support capabilities for future decision-making, but the data could feed advanced cognitive analytics that could be used to test proposed decisions against known unintended cause–effect scenarios developed from past decisions.

Finally, it is clear that more accurate and earlier prediction of emerging issues related to environmental settings would enhance the ability to incorporate resilience strategies into any new (required) infrastructure design. Incorporation of resilience in the context of sustainability would have implications for the design and planning of projects (particularly urban infrastructure projects) that include and integrate new emerging issues into their design. Currently, this remains a challenge to accomplish as no comprehensive tool for quantifying resilience is available.
